Post Office. The audited revenues of the post office department for the fiscal year ended June 30, 1940, amounted to \$766,948,626.74, which was the largest in the history of the service, exceeding by \$20,993,551.50 the previous banner year of 1939, an increase of 2.82%.

The audited expenditures for the department during the fiscal year of 1940 were \$807,732,865.48, leaving a gross deficit which included various non-postal items such as franked mail, air mail subsidy, penalty mail and publications free in county, of \$40,784,238.74. Deducting all these non-postal items which totalled \$59,393,274.75, as authorized by act of June 9, 1930, left a net postal surplus for services rendered for hire of \$18,609,036.01. This was the sixth net postal surplus during the past seven years.

In addition to its customary functions the post office department performed many other important public duties, including the sale of United States savings bonds, which during the fiscal year ended June 30, 1940, amounted to \$847,180,000.00.

Air Mail.—At the end of the fiscal year 1940, the aggregate length of all domestic air mail routes was 37,943 mi., an increase of 894 mi. during the year. A total of 18,671,367,440 pound-miles of air mail service were performed as compared with 15,818,617,372 pound-miles during the fiscal year 1939. The pre-audit estimate of air mail postage revenue for the fiscal year 1940 is \$19,100,000, an increase of 16.38% over the previous year.

"THE BRITISH ARE COMING!" by Russell of the *Los Angeles Times*, illustrates the sharp protests of the U.S. department of state in Jan. 1940 over British seizures of American mail destined for central Europe

Within the fiscal year service was inaugurated on two new domestic routes as follows: Route 44, between the terminal point Kansas City, Mo., the intermediate point Chicago, Ill., and the coterminal points Newark, N.J. and New York, N.Y., and between the terminal point Kansas City, Mo., the intermediate point Chicago, Ill. and the terminal point Pittsburgh, Pa.; Route 45, between the terminal point Saint Paul-Minneapolis, Minn., and the terminal point Duluth, Minn.-Superior, Wis.

There was a substantial increase over the year 1939 in the amount of air mails transported over foreign routes, amounting to 78.4% in mails dispatched and 75.7% in mails received. This increase in air mail, which included the mail carried on the transatlantic route, was largely accounted for by this one route. The mail dispatched on other routes increased 32.2%; the mail received increased 16.4%.

There were (Jan. 1, 1941) 45,331.4 route miles embraced in the foreign air mail service, over which 5,907,124.5 miles were flown during the fiscal year.

During the year the transatlantic air mail service was increased to three trips a week, all of which were on the southern route, between New York and Lisbon. Service once every two weeks was inaugurated July 12, 1940 on a new route in the South Pacific from San Francisco to Auckland, New Zealand by way of Los Angeles, Honolulu, Canton island and Noumea, New Caledonia. Twice-a-week service between Seattle, Wash. and Juneau, Alaska was started on June 20, 1940.

The United States foreign air mail system served directly 81 cities in the following places: Canada, Europe, Cuba, Mexico, Central and South America, Hawaii, Asia, New Caledonia, New Zealand, as well as Alaska, the Philippine islands, Canton island, Puerto Rico, the Canal Zone and Guam. During 1940 Shediac, Moncton, Foynes, Southampton and Marseilles ceased to receive direct service on the transatlantic service. Montevideo, Uruguay, was suspended as a stop in the South American service.

Buildings.—During the fiscal year 1940, 204 new and additional federal buildings were occupied, 11 extensions to existing build-

ings were completed, and 14 new federal buildings replaced a like number of old buildings which had become inadequate for government purpose.

Nearly 400,000 people earned their living in the postal service in 1940, of which more than 268,175 were regularly employed. Frank C. Walker, of Pennsylvania, was appointed postmaster general Aug. 31, 1940. (J. W. Co.)

Great Britain.—As in the case of so many other British business activities, it was impossible in 1940—the second year of the war—to assemble precise statistics. Increases in postal, telephonic and telegraphic charges were announced in the April 1940 budget, which in a full year were estimated to bring in an additional £11,400,000. A certain amount of dislocation occurred as a consequence of the intense air war of the second half of 1940; and some aspects of the resultant delays were the subject of criticism in the press and in business circles, but the post office authorities, maintaining the well-deserved reputation of their department for efficiency, promptly took steps to rectify those causes of delay which were under their control. There was a continual and expected decline in the volume of postal traffic—due partly to the increased charges and partly to the restriction of advertising circular distribution and the almost total elimination of football-pool business—but actual receipts fully justified expectations.

In the first few weeks of 1940 interference was caused by I.R.A. bombings in London, Liverpool, Manchester and other centres, especially to mails at railway stations and in pillar-boxes; but strong measures were taken, and nothing was heard of these after March. By this time events on the continent were seriously impairing overseas communication, the difficulties of which were vastly increased by the fall of France and by the closing of the Mediterranean following the Italian entry upon the war arena in June, which led, *inter alia*, to the temporary suspension of the empire air services. These were later resumed to a limited extent, mails being carried by sea to South African ports for transmission by air to India, Australasia and the far east, while for the Americas, and also for New Zealand and Australia, the "Clipper" service via Lisbon was used. Important diplomatic documents, mails and freight were also carried on the ten crossings from Ireland to Newfoundland by the British flying boats "Clare" and "Clyde."

Penny postage was introduced into Great Britain on Jan. 10, 1840, and to commemorate the centenary the Postal Historical society held a dinner on that date in 1940, and in May special stamps ($\frac{1}{2}d.$, $1d.$, $1\frac{1}{2}d.$, $2d.$ and $2\frac{1}{2}d.$) bearing the heads of Queen Victoria and King George VI were issued, and a very successful exhibition, under the auspices of the Royal Philatelic society, was opened by the duke of Gloucester. (See PHILATELY.)

(L. H. D.)

Potash. The crude potassium salts output of the world is almost exclusively the chloride or sulphate, with a small proportion of nitrate and carbonate, produced primarily for fertilizer use; only a very small amount goes into industrial chemicals, and even in the United States, where the industrial demand is probably higher than in any other country, with the possible exception of Germany, the chemical salts comprise only about 10% of the total. World production decreased from 2,800,000 metric tons of K_2O equivalent in 1929 to 1,400,000 tons in 1932, increasing to 3,105,000 tons in 1938, distributed as follows: Germany 60%, France 19%, United States 9%, soviet union 9%, and Poland 2%; the remaining 1% comes from Palestine, Spain and several still smaller sources.

The production of potash in the United States was a World War development that has been growing steadily since the postwar slump. In 1929, five plants produced 61,590 short tons of K_2O

equivalent and expansion continued throughout the depression with practically no break; ten plants produced 192,800 tons in 1935 and six plants turned out 307,051 tons in 1939. In spite of this heavy increase in production the demand far exceeded the supply and imports increased to 243,600 tons in 1935 and 319,700 tons in 1937, but decreased to 193,600 tons in 1938 and 97,900 tons in 1939. Sales of potash salts in the United States in 1939 amounted to 861,400 short tons, equivalent to 464,200 tons of K₂O. (See also FERTILIZERS.) (G. A. Ro.)

Potatoes. Surplus crop conditions were created in the United States by the 1940 production of potatoes, estimated Dec. 1 by the department of agriculture as 397,722,000 bu. The 1939 crop was 363,159,000 bu. The ten-year (1929-38) average was 366,949,000 bu. The yield of 130.3 bu. per acre was the highest on record and compared with 120.3 bu. in 1939 and a 10-year average of 111.5 bu. Potato consumption in the United States has declined steadily since 1900, concurrent with a steady increase in the consumption of fresh and canned vegetables. In the face of declining consumption and the surplus 1940 crop the federal Surplus Marketing administration adopted various measures to relieve the surplus and support the market. The Surplus Marketing administration is a new governmental agency, created in 1940 by merging the marketing division of the Agricultural Adjustment administration with the federal Surplus Commodity corporation. The SMA revived the plan of 1937-38 when the government diverted 3,680,000 bu. of a surplus potato crop to the manufacture of starch in Maine, which is the centre of the potato starch industry. The SMA authorized federal payments of 14½ cents per bu. (60 lb. to the bushel) for 1940-crop potatoes diverted to starch manufacture. Up to Sept. 14 the SMA had bought 1,500,000 bu. of potatoes of the 1940 crop for relief distribution and subsequently made purchases of hundreds of cars for the same purpose. In addition, potatoes were put on the surplus commodity lists of 150 cities where relief foods are distributed according to the government's stamp plan to encourage consumption of surplus products. Potatoes were also put on the menu of free lunches given to needy school children. An average of 1,200,000 children received such lunches in 1939 and it was announced by government sources that an effort would be made to serve 6,000,000 in 1940.

While no official figures were forthcoming from many governments the U.S. department of agriculture received information that central Europe had a good potato crop in 1940. Except in Belgium and France, where the crop was much below average

owing to neglect of farming during the first months of invasion, there was no scarcity of potatoes, which were one of the foods sufficiently plentiful in Germany as not to require rationing. Before the European war annual production of potatoes in continental Europe (Russia excluded) averaged 142,000,000 metric tons, with consumption averaging 126,400,000 metric tons annually. The table shows production in the United States in 1940 and 1939 by states. (See also SWEET POTATOES.) (S. O. R.)

Poultry. A slight decrease in chicken and a small gain in turkey production was reported for 1940 by the United States department of agriculture. The turkey crop, 33,138,000 birds, was the largest on record, comparable with 32,732,000 in 1939 and a five-year (1932-36) average of 23,081,000. Chicks, produced by commercial hatcheries that report to the department of agriculture, numbered 99,661,000 the first ten months of 1940 compared with 111,947,000 the same period in 1939, a decline of 11%. Advance orders for hatchery chicks Nov. 1, 1940, were, however, 11% more than on the same date in 1939. (For numbers of hens on U.S. farms see EGGS.) Cold storage holdings of all poultry Nov. 1 were 114,625,000 lb. in 1940 and 79,200,000 lb. in 1939. Of these 1940 holdings 11,700,000 lb. were turkeys, compared with 8,000,000 lb. in 1939. Prices for chickens ruled moderately higher in 1940, but for turkeys the fall season opened with pronounced weakness because of the record production. To support the turkey market the federal Surplus Marketing administration announced it would buy turkeys for consumption in free school lunches for undernourished children. At approximately the same time as this announcement, a sudden storm, Nov. 9, swept the middle west with freezing temperatures, killing many thousands of turkeys. Estimates of the loss ranged from 800,000 to 1,250,000 birds. Whole flocks were wiped out and some large growers lost as many as 4,000 turkeys. The storm reduced the 1940 turkey supply to near 1939 levels and apparently removed the threat of a cumbersome surplus. The Surplus Marketing administration suspended its proposal to buy turkeys. By December turkey prices had firmed. The federal Agricultural Marketing service reported that turkey specialists at the department of agriculture research centre, Beltsville, Md., were experimenting in developing a "small streamlined bird" as more adapted to U.S. family needs than the heavier commercial bird. Turkey growers, however, favour development of heavy birds with larger breasts. Owing to the larger portions of white meat, restaurants now find it profitable to serve turkey meat in so-called chicken sandwiches. (S. O. R.)

Presbyterian Church. The Reformed Churches holding the Presbyterian System, located within the U.S.A., are twelve in number and included in 1940 18,387 ministers, 18,877 churches and 3,990,009 communicant members with approximately 7,500,000 adherents. Outside of continental United States they had 2,204 American foreign missionaries and 13,708 native workers in a total of 21 countries and a communicant membership of 234,101.

The notable increases in church membership reported in 1939 were greatly augmented, the Presbyterian Church in the United States of America and the Southern Presbyterian Church reporting the largest accessions in many years and the greatest communicant memberships in their history. All associated in the National Preaching mission, a series of eight-day evangelistic meetings and conferences in 22 leading cities, and participated in the World Wide Communion service on the first Sunday in October.

In the General assembly of the Presbyterian Church in the United States of America gratification was expressed over the continuance of efforts in search of suitable ways and means of bringing into one Christian fellowship all branches of the Presbyterian family with specific overtures to the Southern and United Presbyterian Churches. Definite progress was reported in the negotiations on organic union with that body and the Protestant Episcopal Church. Emphasis was laid upon the efforts of the World Council of Churches to maintain the fellowship of believers in belligerent areas, thus transcending national and racial boundaries and contributing to mutual understanding and the ultimate consummation of world peace.

The Evangelical and Reformed Church officially put its new constitution into operation, thereby completing the organic union of the Evangelical Synod of North America and the Reformed Church of the United States. Preliminary steps toward union were taken in 1934 when the two churches merged on a basis of mutual respect and confidence. The new church had in 1940 34 synods, 2,478 ministers, 2,873 congregations with a total communicant membership of more than 650,000 and a Sunday school enrolment of almost 600,000.

Maintaining their fundamental belief that "God alone is Lord of the Conscience," several of the supreme judicatories of the Presbyterian family maintained the Christian right of conscientious objection to military service. All adopted official pronouncements in behalf of religious and political freedom at home and abroad, declaring that such freedom was the absolute prerequisite of the Christian way of life.

The Western section of the World Presbyterian alliance, representing the Presbyterian and Reformed Churches in the United States and Canada, held its annual meeting in Rochester, N.Y., Feb. 1940.

Europe.—War, conquest and mass evacuations in 1940 laid tremendous burdens on the Reformed Churches of Europe, though a consciousness that the oecumenical fellowship was surmounting national frontiers even during war noticeably stimulated their faith, vitality and hope for the future. Churches continually contributed money and effort to care for the members and work of the churches of other lands. In general the churches of all parts of Europe were crippled by loss of personnel to army and navy, destruction of churches, hospitals and other property, and the presence of numerous refugees from other parts of their own land or from abroad. During most of the year some countries were almost completely hidden behind the curtain of censorship, including Czechoslovakia, Estonia, Latvia and Lithuania.

In Britain the Presbyterian churches maintained their activities without panic, supported their usual benevolent agencies, contributed largely to the aid of missionary work of the churches of Germany and Holland, carried on Christian service for evacuated pastors and parishioners, for thousands of refugees from the continent and for British soldiers and sailors.

The Church in Germany maintained its work, cared for war prisoners and internees, established "Evangelical Relief Work" as a liaison organization between the German authorities and foreign and domestic relief agencies, and assumed care of the members of the Reformed Church who were among the 500,000 persons received into Germany from the Ukraine.

The Reformed Church of France, opening headquarters in Nîmes, devoted itself principally to maintaining its missionary and benevolence work while its financially strongest churches were still cut off in occupied France. Both in France and in Switzerland the Church gave large sums of money to support thousands of Evangelical refugees from Germany.

The German Evangelical churches in Poland were in process of assimilation into the German Church. Little reliable news came

out of Russian Poland.

Much distress was reported from the Evangelical churches of Belgium and Holland; numbers of church edifices were destroyed. In Italy the Waldensian Church effectively carried on its own work and also some activities ordinarily supported by the British churches. (W. B. Pu.)

Presidents: see SOVEREIGNS, PRESIDENTS AND RULERS.

Prices. Commodity prices in leading world markets during 1940 were dominated largely by war developments in Europe and the far east, and also, in the latter part of the year, by military preparations in the United States.

Following the sharp rise in commodity prices in most markets immediately after the outbreak of the European war in Sept. 1939, prices in the countries at war generally advanced further, reflecting sharply restricted supplies in many cases and also unusually large demands for essential commodities. Prices outside the war zones, on the other hand, were generally maintained or tended downward until late in the spring of 1940, reflecting chiefly reduced demand for commodities on the part of manufacturers and traders in the U.S. Early in the year the outlook for world supplies of major agricultural products changed little and foreign exchange rates and shipping charges were fairly stable.

After the early part of May, with the intensification of war on the European continent, price changes were mixed for several months but outside Europe declines predominated. Commodities usually exported to the continent in important volume—including grains, coffee, copper, lead and hides—showed price decreases in producing countries as continental markets were closed by the British blockade. Other commodities such as wood pulp and paper advanced as Scandinavian sources of supply were cut off from markets in the rest of the world.

In the autumn, prices in unrestricted world markets were influenced upward chiefly by the undertaking of a large-scale defence program by the United States and by the increased destruction of world shipping facilities.

United States.—Prices of commodities in wholesale markets in the United States declined generally in the first half of the year and rose in the latter part to about the same level as at

Fig. 1.—WHOLESALE PRICES IN THE UNITED KINGDOM AND THE UNITED STATES. (Source: United Kingdom—Board of Trade, converted to 1926 base; United States—Bureau of Labor Statistics) War conditions in the United Kingdom have made many price quotations nominal; undoubtedly the index for that country understates the rise during 1940

Fig. 2.—WHOLESALE PRICES OF INDUSTRIAL COMMODITIES IN THE UNITED STATES. (Source: Bureau of Labor Statistics data classified by Board of Governors of the Federal Reserve System)

the end of 1939, as shown in fig. 1. Throughout the year, the general level of wholesale prices in the United States was lower compared with prewar than in most other leading countries.

The lower level in the United States reflected partly smaller advances in prices of raw materials. The United States relied far more on domestically produced materials than, for example, the United Kingdom, and price increases for these commodities were less marked than for imported materials. Further, prices of United States imports remained at a lower level than those of the United Kingdom, owing to smaller advances in shipping costs to the U.S. and the fact that there was no depreciation of the dollar in the foreign exchange markets. Also, during most of 1940 there was considerable unused plant capacity and labour in the United States, except in a few lines, which tended to prevent large increases in prices of manufactured goods.

The wave of buying in the United States that followed the outbreak of the European war in Sept. 1939, extended beyond basic commodities into many industrial products. By the beginning of 1940 inventories had been built up in anticipation of further price increases and to ensure manufacturers of adequate supplies of materials. During the early part of the year, with industrial production reduced to a level closer to ultimate consumption, demand for raw and semifinished industrial materials fell off considerably and there were decreases in prices of these commodities, as indicated in fig. 2. Prices of finished industrial products, which had shown a smaller advance in the latter part of 1939 than prices of materials, were mostly maintained at the higher levels. The decline shown for the group reflected chiefly decreases in prices of refined petroleum products resulting from large domestic output and reduction in foreign demand.

In May, with the sudden change in the military situation in Europe, certain commodities which had been held partly for speculative purposes showed sharp price declines, although industrial production in the U.S. began to increase again at this time. Wheat prices, for example, which had been over \$1 a bushel, dropped to about 70 cents and grain markets in the U.S. and Canada were closed for a short period to restore more orderly conditions. During the summer, with the capitulation of France and the extension of the British blockade, prices in the United States declined further, reflecting the pressure of foreign supplies of such commodities as copper, lead, coffee and cocoa,

which had been cut off from continental markets.

At this time, however, demand for commodities increased in the United States as industrial production rose sharply and exports of manufactured products were maintained at a high level. A large-scale defence program was inaugurated during the summer involving the proposed expenditure of about \$6,500,000,000 in the fiscal year ending June 30, 1941. With the subsequent bunching of government military contract awards in September and October for this program, there was a large forward buying move on the part of manufacturers to cover requirements and, with increased demand also from civilian sources, fairly tight market situations developed for such basic materials as wool, copper, zinc, steel and lumber. Prices of many of these commodities showed large advances and there were smaller increases in a number of other commodities including some manufactured goods such as automobiles. At the end of the year prices showed more stability.

During this period of the second half of the year industrial activity rose to new record levels. Changes in costs were varied and to some degree offsetting; while prices of materials increased in many instances, costs of manufacture were often lowered as a result of higher rates of operation. Wage rates generally showed little increase and corporate profits, after allowances for increased taxes, were much advanced over 1939.

In connection with the defence program the federal government had adopted a policy directed to the stabilization of commodity prices, and many sellers exercised restraint in pricing their products in this period of sharply increased demand. The government also initiated a program during the summer for accumulating stockpiles of such strategic imported materials as rubber, tin and ferromanganese, to be used in the event that normal supplies were cut off. This action was an important influence in strengthening both domestic and world prices of these commodities. Contract conditions under which these stockpiles were to be accumulated were such as to withhold them from the market for some time to come. Arrangements were also made by the government for the accumulation of large supplies of foreign copper and wool.

Production of major crops in 1940 was about average and, with domestic carryovers heavy and export demand curtailed to the lowest level in many years, supplies of staple farm products were large throughout the year. Prices of cotton, wheat and

Fig. 3.—RETAIL PRICES IN THE UNITED KINGDOM AND THE UNITED STATES. (Source: Cost of living indexes. United Kingdom—Ministry of Labour, converted to 1935-39 base, first-of-month figures; United States—Bureau of Labor Statistics, mid-month figures quarterly in recent years) See note to fig. 1

corn, however, remained close to the minimum levels at which the government granted loans to producers participating in the federal farm program and for a number of farm products and foods largely consumed in the domestic market, there were price advances in the latter part of the year due to the rise in consumer incomes. At the end of the year, prices of livestock and their products as a group were about 10% higher than at the beginning of the year, while prices of principal crops and their food products were about 5% lower.

Prices of commodities in retail markets in the United States showed little change during most of 1940 but generally were somewhat higher at the end of the year, reflecting chiefly rises in foods, particularly livestock products, and small advances in prices of clothing and rents; the total cost of living was only slightly higher than during 1939, as shown in fig. 3.

United Kingdom.—Wholesale prices in the United Kingdom generally rose sharply throughout 1940 with the largest increases after May, as shown in fig. 1. The rise, which occurred despite governmental control of the distribution and prices of many commodities, reflected partly marked advances in costs both of domestic and imported raw materials. Increases in the latter group, however, were much larger than for domestic commodities, owing chiefly to the closing off of supplies from the Baltic, Scandinavian and Low Countries, increased difficulties in securing supplies from other areas, and sharply advanced shipping charges. As a result of foreign exchange controls established in March and June to reduce the amount of sterling in non-British hands, currency depreciation was no longer an important factor in increasing domestic prices of international commodities. Most of the effects of depreciation on these prices had been felt following the outbreak of war, when the official sterling rate declined from \$4.68 to about \$4.00 to the £. This had required the payment of more sterling currency and thus increased prices for many imported materials.

Demand for both imported and domestic commodities was sharply increased after the middle of the year as a result largely of heavy national war expenditures, dislocation of productive facilities, destruction of supplies and equipment and rising consumers' income as a result of greater employment and increased overtime payments.

The various governmental price arrangements undertaken in the latter part of 1939 were extended further in 1940. Trading in only a few commodities, including cotton, rubber, jute and tin, was left comparatively unrestricted. Also, the prices established for such commodities as copper, lead, spelter, steel and timber, which had been fixed at the beginning of the war, were raised from time to time during 1940. The program for bulk governmental purchases of empire and dominion products, such as wheat, cocoa, wool and non-ferrous metals, was continued. Many special measures were adopted to reduce imports of non-military commodities from sources outside the empire. Also, the government encouraged exports in order to conserve currency exchange resources.

Early in the summer, in response to a growing recognition that the war effort was inadequate, the ministry of supply was given complete authority to control the procurement of commodities and all aspects of manufacturing and distribution. Price changes in individual lines were thus greatly affected not only by wartime economic conditions affecting their supply and demand, but also by a broad system of administrative controls by the government and private business groups acting under governmental authority.

Rationing of a number of basic foods to individual consumers and controls of retail prices and margins were continued under the direction of the ministry of foods. An attempt to stabilize retail prices of major foods entailed payment of subsidies amounting to around £1,000,000 per week by the government.

Prices of other essential consumer goods were subject to control by the board of trade under the Prices of Goods act, effective Jan. 1 on a limited range of clothing and household goods and extended in June to cover most household necessities. The act provided that increases in wholesale and retail prices should not exceed increases in costs of producing and selling these goods.

More important measures affecting prices were the Limitation of Supplies Order and the Purchase tax. Under the former, which became effective in June, quotas were established for the sale of consumers' goods by manufacturers to the retail trade, restricting such sales to two-thirds of the value of sales in the preceding six months. Under the Purchase tax program, which became effective at the end of October, taxes from one-sixth to one-third of the wholesale value were placed on domestic ironware, clothing materials, garments and footwear except children's. Commodity prices were also affected by large increases in indirect taxes on beverages, sugar and tobacco. These actions, which were designed to conserve supplies and to encourage the transfer of facilities from non-essential to essential work, tended to limit further civilian purchases of commodities.

Thus while the various governmental measures had the effect of accelerating the rise of some prices and retarding increases in others, the underlying economic effects of the war resulted in a continued advance for both wholesale and retail prices during the latter part of the year. Living costs at the

end of 1940, according to the official index shown in fig. 3, were about one-fourth higher than in Aug. 1939. (See also AGRICULTURE: *Foreign Trade and Agriculture*; COST OF LIVING; FINANCIAL REVIEW; and articles on individual commodities.) (C. GN.)

Primary Education: see EDUCATION, ELEMENTARY.

Prince Edward Island, the smallest in area but the most densely populated province in Canada, lies in the Gulf of St. Lawrence in the shape of a crescent, its inner side towards the north. It is nine miles from the mainland; across the separating strait powerful ice-breaking ferry-boats ply in winter and summer carrying railway cars, automobiles, passengers and freight, the crossing taking 40 minutes. There was also in 1940 a daily air mail and passenger service connecting with transcontinental Canadian airways and American and Canadian Colonial airways. The island is 137 mi. long, and varies in width from 2 to 32 miles. It contains 2,133 sq.mi. The population, Canadian census 1931, was 88,038; estimated Dec. 31, 1940, 93,000 of which 81% is rural. Charlottetown, the capital, 12,361; estimated Dec. 31, 1940, 13,500. Of the island's population 80% is of British descent; 14% French; 42% is Roman Catholic and 58% Protestant, of which 28% is of the United Church, 18% Presbyterian; and 6% Anglican.

To Dec. 31, 1940 the estimate of revenue was \$1,800,000; estimated expenditure, ordinary, approximately the same; capital expenditure including provision for sinking fund \$850,000, of which interest absorbed over \$300,000. The dominion subsidy was approximately \$650,000. Of the revenue, \$370,000 went to education, the total cost of which was \$550,000. Pupils enrolled were 18,800; cost per pupil \$30; teachers 700; average salary \$505. The public debt Dec. 31, 1940 was approximately \$6,000,000; per capita \$67. Income, real estate and succession taxes are moderate.

The main occupations are agriculture and fishing; 485,000 acres are under cultivation. The capital investment in agricultural industry in 1940 was \$53,500,000; in manufacturing industry, \$2,500,000. The estimated total value of farm products in 1940 was over \$13,000,000; potatoes (approximately) 7,800,000 bu.; turnips 5,000,000 bu.; oats 5,000,000 bu.; wheat 250,000 bu.; hay and clover 335,000 tons; mixed grain 1,625,000 bu.; barley 350,000 bu.; butter 2,000,000 lb.; cheese 470,000 lb.

The estimated value of fisheries was \$600,000; oysters 850,000 lb.; estimated fox pelts, 80,000, valued at \$1,500,000. There is little serious crime, and practically no illiteracy. (Cy. M.)

Princeton University during 1940—its 193rd year—improved its curriculum, in pursuit of a policy of meeting the needs and aptitude of the individual undergraduate.

It rearranged its academic calendar to allow extension of the opportunities of "reading periods," previously restricted to upperclassmen, to freshmen and sophomores. A creative arts program was introduced, designed to permit talented undergraduates to approach the study of art, music and literature from the viewpoint of the artist rather than that of the objective scholar. It again geared itself to meet a national emergency, offering all of its facilities for the prosecution of the defence program. Various projects were assigned to its scientific laboratories. Among new research projects was a study of the effect of the European war upon public opinion in the U.S.A. Gifts received totalled \$1,287,056. Enrolment, which is controlled by a policy of limitation, was 2,707, of which 302 were graduate students. The teaching staff numbered 412. (H. W. Do.)

Printing. Printing inks featured graphic arts developments during 1939, but presses stepped into the spotlight during 1940. Major printing methods have individual advantages. Relief (letterpress), the most extensively employed, supreme for sharp impressions of type and bringing out fine detail in continuous tone (photographic) illustrations. The great advantage of intaglio (photogravure and rotogravure) is that it most closely approximates the appearance of a genuine photograph. This is due to the wider range and greater depth of tones the method provides. Offset (planography and lithography) is most economical, especially where there is a considerable number of illustrations. While the quality of offset approached that of letterpress in a general way, and coated paper might now be used, it is the superior method where a water-colour painting must be reproduced. Character of colouring and adaptability to rough papers account for that advantage.

The foregoing is introductory to a development in process in 1940—presses which would print letterpress and gravure, say, simultaneously just as the two-colour press prints two colours but simultaneously. The object of such combination presses is to utilize the best method for the type and the best, or most economical, method as the case might be for the illustrations.

The greatest development during 1940 was a combination relief and offset press. Unlike the projected developments noted above, this machine works one process or the other, one at a time only. Certain adjustments, swiftly made, convert the machine from offset to letterpress or vice versa.

Only two cylinders are used for offset work instead of the conventional three-cylinder offset press construction. The upper cylinder is composed of a plate segment and an impression segment and is twice the circumference of the blanket cylinder. Thus the blanket cylinder takes its impression on the first revolution, then transfers it to the paper during its second revolution as the impression segment reaches it.

Changing to relief printing requires but a few minutes. The dampening unit is lifted off, the plate segment removed and a channel segment for loose type and electros, or a segment for mounting rubber plates is readily substituted. The blanket cylinder then becomes the platen and the machine is ready to operate letterpress.

The method best adapted to the particular item to be printed may be utilized with only the one press. While this machine was in 1940 built only in small size for office use, like the multi-graph, the manufacturers contemplated larger presses for the printer.

Use of rubber in printing grew apace because of economy in plate costs and preparatory work (make ready) on the press. Due to resiliency of rubber, plates moulded from it adapt themselves somewhat to the uneven surface of paper and inequalities in the press itself, which is not the case, of course, with unyielding metal. During the year a new and rather large press built for rubber plates only was introduced for producing books and catalogues. It was anticipated that considerable savings could be accomplished, particularly on books, like novels, which are not illustrated.

A new metal plate for illustrations is of thin copper. Between this and the wood mount is a layer of medium rubber. The theory, and it seems a sound one, is that while retaining the advantages of etching and of the metal printing surface, there is that resiliency which permits of less preparatory work before the press is started.

An ink-drying mechanism for any type of roll- or sheet-fed press was developed which, it is claimed, cuts drying time in half. Its principle is the same as that of the sun heating the earth. Heat energy radiated by the sun makes a mountain climber

MIXING PIGMENT COLOUR with varnish—the first step in the manufacture of ink. Instant-drying inks perfected in 1939-40 made possible much faster printing of magazines, newspapers, packages and labels

perspire in spite of cold surrounding air. This is "radiant heat"—molecular at the radiator and at the receiver. The transfer from one to the other is by wave motion which wastes no heat.

Radiant heat transmission on a printing press is done by a burner, heated by gas, with refractory surfaces getting as hot as 2,300° F. These surfaces give off infrared heat waves and have the appearance of a string of burning coals.

The burner bars may be attached to a press without changing the press itself, operate on a natural or manufactured gas, have safety devices to prevent accidents, and start and stop with operation of the press.

(J. L. F.)

Prisons. Various new buildings were constructed in prisons of the United States during the year 1940. A shoe factory was added to the Southern Michigan State prison. The Minnesota State prison opened a new farm colony building to house all inmates working outside the walls. At the Huntsville unit of the Texas prison system, a textile mill was erected and the prison stadium originally seating 18,000 visitors was enlarged to accommodate 30,000, the number usually attending prison baseball games or the annual rodeo show.

A hospital and factory building were added to the Indiana State prison, while at the Maine State prison minimum security barracks were built on the farm. The Virginia penitentiary completed a power house and had under construction in 1940 a cell block which will house 500 men. At the Iowa State penitentiary, a power plant was being erected. The Florida State prison completed a new hospital and cell block. A chapel and cell block were added to the Washington State penitentiary; a tubercular hospital to the Louisiana State penitentiary.

At the West Virginia penitentiary plants were installed for the manufacture of paint, soap, tobacco, clothing and sheet metal products for state use. West Virginia also erected a new medium security prison which will accommodate 600 prisoners.

The old cell hall built at the Wisconsin State prison in 1851 was torn down and a new cell block erected. The Oregon State penitentiary reports the construction of a large, modern dormitory on the farm where trustees are employed and a modern dining room, auditorium and hospital in the prison proper.

The federal government opened several new institutions during 1940. The one at Denver, Colo., will be used for the imprisonment of young male first offenders, between the ages of 17 and 25, who are sentenced to serve not more than 18 months, as well as men awaiting trial for federal offences. The Texarkana, Tex., institution will be used for 400 short-term male prisoners from Texas and nearby territory. Short-term male prisoners from Kentucky and adjoining states will be sent to the correctional institution at Ashland, Ky. The Danbury, Conn., institution will be used for male prisoners from New York and New England states with sentences in excess of 18 months. A wall-less penitentiary was also opened in Terre Haute, Ind., to house 1,050 inmates.

At the Wisconsin State prison the silent system, a relic of antiquated penal practices, was at last abolished and inmates were permitted to converse with one another. They were also allowed to smoke cigarettes (previously they could only smoke pipes). For years, any outsider had the right to be taken through the prison upon the payment of a 25-cent admission fee. That practice was discontinued in 1940 and visitation restricted.

Several state prisons report the starting of classification departments and the segregation of various types of offenders. The opening of many farms and road camps allowed the transfer of prisoners, most amenable to reform, to places where they could live a more normal existence than within prison walls.

At the Minnesota, North Carolina and Indiana State prisons, earphones have been placed in each cell so that inmates can hear the radio programs which are transmitted from a master unit in the prison. Formerly, these institutions did not permit that form of entertainment although many others did. The value of radios in prisons cannot be overestimated. Allowing inmates to keep pace with world events, through news and educational broadcasts, and hear entertainment which interests people on the outside, prevents them from deteriorating mentally and losing contact with the community to which they will some day return.

The year 1940 also witnessed improvement in the educational facilities in many prisons, particularly in the field of vocational education. Realizing the necessity for guiding penal officials in this important work, the American Prison association issued several valuable books outlining procedures which can be followed. There was also a decided trend toward training prison guards for their work before assigning them to an institution. During 1940 Michigan was added to the list of states maintaining officer schools.

Because of the European war, little information was available about changes, if any, in European prisons. (L. E. L.)

Propaganda. Only in the light of events as they unfold to form a pattern revealing cause and effect can propaganda strategy be discerned. Events in Europe and America by the close of 1940 revealed Adolf Hitler as one of the most effective propagandists in all history. It was clear as the year drew to a close, that his succession of military victories, which had made him master of Europe from the arctic to the Mediterranean, had come almost inevitably as the result of a shrewdly calculated propaganda campaign which had preceded, accompanied and been co-ordinated with his military strategy of total war.

Hitler once had told Hermann Rauschning in effect that as artillery preparation preceded infantry attacks in battles in the World War of 1914-18, propaganda preparation would precede actual physical warfare in the coming war in order to effect "the psychological dislocation of the adversary."

After Denmark, Norway, the Low Countries and France had fallen before Hitler's lightning strokes in the spring of 1940, it became apparent that France, particularly, had already been defeated by Hitler's propaganda before he had outflanked the Maginot line with his dive bombers and *Panzer* divisions.

His formula in demoralizing democracy in France, to make impotent its military power, was substantially the same formula Hitler had used to bring an end to democracy in Germany. In France, as in Germany, vast numbers were the victims of depression and unemployment. They were confused and desperate, floundering for leadership to bring order out of a chaotic economic situation which seemed to threaten their very lives. Those who still had economic security were fearful of the masses and particularly fearful of group organizations, such as labour unions with programs for more equitable distribution of wealth.

Such had been the situation, too, in Germany in the years before Hitler came to power in Jan. 1933. There his propaganda strategy accomplished three things: First, he gave to the people a scapegoat, the Jewish population, upon which they could lay the blame for their suffering. Second, by picturing himself as the bulwark against Russian communism he won support of industrialists, bankers, journalists, statesmen and churchmen, including the pope who in 1933 signed a concordat with him, thereby transferring to the Nazi government the sanction of the Vatican. Third, he associated "Jews" with communism and communism with democracy, which he called "the foul and filthy avenue to communism." So it was, by the use of the most common of all propaganda devices, name calling, that he made "Jew," "communism," and "democracy" poison words which, with constant repetition, came to evoke automatically a negative response. These words were charged with connotations of evil and wickedness as the word "heretic" had been in the middle ages. The minds of tens of millions not only in Germany but in France, Britain and the United States were conditioned by Hitler to respond negatively and automatically to these poison words. Thus Hitler put to effective use the conditioned reflex principle which earlier had been so clearly revealed by the Russian psychologist Pavlov in experiments on dogs. Pavlov discovered that if a dog is given food its saliva runs automatically; if the ringing of a bell accompanies the feeding, after 40 to 60 feedings the sound of the bell causes saliva to run even though no food is given.

As soon as Hitler was able to make democracy a bad word in Germany by associating it with Jews and communism and as soon as the German people, industrialists, churchmen and masses alike had become conditioned to respond negatively to the word democracy, it was easy for Hitler to destroy democracy in Germany. This he did almost immediately after becoming Reich chancellor.

The same process operated in France, and to less degree in Britain and in the United States where Hitler's propaganda affected, particularly, business, political and religious leaders who feared the potential revolutionary acts of millions who were suffering as the result of depression and unemployment. It became popular among these leaders in western Europe and America to see in German and Italian fascism a necessary "defence mechanism" against "communism"; and to their minds the specific democratic rights of criticism and organization were "communist." The fact that Stalin and his followers, in the year immediately preceding the war beginning in 1939, espoused democracy as cordially as Hitler opposed it caused many to believe that Hitler was right—that democracy was the "foul and filthy avenue to communism."

Thus it was that Hitler, after he had come to power in Germany in 1933, was encouraged by the statesmen of France and Great Britain to build a powerful military machine. They saw him as their bulwark against the Soviet Union, as the defence against "communism" at home as represented by demands of labour unions for higher wages and shorter hours and by demands for the socialization and democratization of industry. In foreign policy, therefore, they gave backing to Hitler in his help to set up a fascist Spain under the leadership of General Franco. They approved the Austrian Anschluss and the ceding of the Sudetenland area of Czechoslovakia culminating in Munich. As Hitler's military power increased, the strength of his propaganda grew. His purpose was not to win friends for Nazi Germany, but rather to make the peoples of France, Britain and America weaken themselves by internal dissension. His strategy was to set Gentiles against Jew, Protestant against Catholic, capital against labour and anti-communist against "communist"—thus to sow seeds of

doubt, suspicion, jealousy and hatred, culminating in apathy, defeatism and demoralization. Munich marked a high point of success of this policy. Chamberlain and Daladier won acclaim because they had secured "peace in our time." President Roosevelt was lauded for his part in making the Munich pact possible.

The cumulative effect of Hitler's anti-democratic propaganda continued after the outbreak of war. The early months of war were so quiet as to cause many to term it a "phony" war. In this period Britain and France tried to win fascist Italy to their side, and American shipments of oil and scrap iron to Italy mounted higher and higher. At the same time Britain and France made preparations to fight Russia by encouraging Finland's resistance to the soviet union. In the minds of Chamberlain and Daladier there still lingered, apparently, the belief that communism and democracy were the real enemies and that fascist Germany—if Hitler were overthrown by an army revolution—might join with Britain in war on the common enemy, Russia. Hitler's lightning invasion of Norway ended this dream, tumbled Chamberlain from his position as prime minister of Great Britain and replaced him with Winston Churchill.

Through all the years preceding the outbreak of war, Churchill, anti-nazi Tory and himself a dynamic propagandist, saw Britain's chief enemy not in Stalin but in Hitler. With the beginning of Hitler's *Blitzkrieg* in the west the British people who had supported Chamberlain in his appeasement policy began to demand its replacement by Churchill, the outstanding and consistent opponent of appeasement. It was Churchill, as national leader, as master-persuader of men, who checked Hitler's power and rallied England and the United States against "defeatism." In this he was reflecting the fighting spirit of the British people in words which revealed his extraordinary ability as a propagandist: "I have nothing to offer but blood, toil, tears and sweat." Later, stating the policy of his government, he declared: "I say it is to wage war by land, sea and air—war with all our might and with all the strength God has given us. . . ." "We shall defend our island whatever the cost may be: we shall fight on beaches, landing grounds, in fields, in streets and on the hills. We shall never surrender. . . ."

Hitler met, for the first time, a peer in propaganda. Nonetheless, he still held the initiative. In the democracies his propaganda, through the

preceding years, had undermined faith in democratic criticism, in labour unions, in government measures for the unemployed. It had caused some men in positions of economic power as well as some educators, politicians and clergymen to see in these things the spectre of "communism." So thoroughly had the minds of such men in England been conditioned by Hitler's anti-democratic propaganda that Churchill's attempts to woo Russia to Britain's side were unsuccessful. Competent though he might be as a national leader and propagandist, Churchill was unable, immediately, to remove Hitler's appeasers from the British cabinet and to replace them with men who had a stronger belief in democracy. This, together with the failure of Britain to grant independence to India, operated as an inhibiting moral factor in winning stronger support for Britain in America.

The cumulative effect of Hitler's anti-democratic propaganda, strengthened as it had been by Stalin's support of Loyalist Spain and the Popular Front in France, explained at least part of the reluctance of most Americans to participate in the European war. That reluctance was explained, also, by the disillusionment which had followed the war of 1914-18 "to make the world safe for democracy" and by the belief that the European war was merely a repetition of the war of 1914-18.

These factors must be kept in view in analyzing the great propaganda campaigns directed at Americans during 1940. In essence these centred on one issue—aid to Britain against Hitler. This issue was dominant in the presidential campaign. Most Americans wanted Britain to win, President Roosevelt, who was breaking the third term tradition by running for reelection, propagandized by act and word for aid to Britain. His acts included endorsement of peacetime conscription (enacted into law before election day) and the deal which gave Britain 50 U.S. destroyers and the U.S. the right to establish naval bases on British territory in the western hemisphere. His frequent denunciations of nazi and Italian fascist aggression were in words more effective than those of Winston Churchill.

Roosevelt's propaganda was crucial in counteracting the propaganda of Americans who believed in a policy of isolation. The isolationists included men like Senator Robert Taft and Senator Arthur H. Vandenberg, who had campaigned for nomination for president on the Republican ticket. That nomination went to a former Democrat, a public utility executive, a propagandist against Roosevelt's New Deal, Wendell L. Willkie. Many believed that Mr. Willkie, if elected president, would follow the program of the isolationists. This belief was dissipated when, against the wishes of isolationist supporters like General Hugh S. Johnson and John T. Flynn, Mr. Willkie endorsed the destroyer-naval base deal and the Roosevelt policy to give Britain all aid "short of war." But while Mr. Willkie talked about such aid, Mr. Roosevelt, as president, could and did act.

His acts were more effective propaganda than Mr. Willkie's words. Furthermore, Mr. Willkie was supported by numerous individuals and groups who if not anti-British were vociferous propagandists against aid to Britain which might lead to war.

The presidential campaign was, therefore, a propaganda battle confused by widely divergent opinions as to what should be done to save America from the menace of Hitler. Interventionists and isolationists alike proclaimed their desire to defend America. Interventionist propagandists, like those of the powerful William Allen White Committee to Defend America by Aiding the Allies, together with President Roosevelt and most of the influential newspapers, saw England as America's "first line of defence." Many of the isolationists, represented, for example, by such an organization as the America First committee, feared involvement in war if "all-out" aid were given. It would seem that the United States people believed some help should be given to Britain. They differed on how much.

Despite advisers who urged an isolationist policy, Wendell Willkie endorsed President Roosevelt's policy of full aid to Britain. Roosevelt's earlier foreign policy had paralleled Britain's plan of appeasement with respect to both Spain and Munich. By May 1940 Roosevelt's foreign policy, like Britain's under Churchill, was nonappeasement, emphatically so. Willkie came out against conscription of wealth while Mr. Roosevelt supported it—in principle. Mr. Roosevelt was elected. The campaign to aid Britain, hardly interrupted by the presidential campaign, went ahead at increased speed. Despite counterpropaganda of the America First committee and the No Foreign War committee, at the close of 1940 many students of world events believed that the threatened defeat of England and the aid-to-Britain propaganda would get the U.S. into the war by the spring or early summer of 1941, possibly earlier.

Their belief was strengthened by Roosevelt's radio address to the nation on the evening of Dec. 28 when he said: "Never before since Jamestown and Plymouth Rock has our American civilization been in such danger as now. . . ." "If Great Britain goes down . . . all of us in the Americas would be living at the point of a gun. . . . To survive in such a world, we would have to convert ourselves permanently into a militaristic power. . . ." "We must be the great arsenal of democracy."

Throughout 1940 Roosevelt had collaborated closely with various representatives of the British government, but particularly with the British ambassador to the United States, Lord Lothian, who, up until the time of his death in December, had revealed himself as a brilliant propagandist in marshalling American aid to Britain. Co-ordinating their propaganda with that of Roosevelt and Lord Lothian were the William Allen White committee and many groups and individuals, among them: University presidents like J. B. Conant of Harvard, Nicholas Murray Butler of Columbia, Charles Seymour of Yale; journalists like Dorothy Thompson, Ralph Ingersoll, Walter Lippmann; newspapers like the *New York Times*, the *New York Herald Tribune*, *PM*, and the *Chicago Daily News*; liberal journals like the *Nation* and the *New Republic*; Henry Luce's publications—*Time*, *Life* and *Fortune*; ministers like Bishop William T. Manning and Reinhold Niebuhr.

As the year 1940 ended, three extraordinarily effective propagandists were struggling for world mastery. On one side was Hitler; on the other were Churchill and Roosevelt. Hitler still held the initiative, but in the last half of the year he had been noticeably checked by his two powerful adversaries. They, like Hitler, himself, were co-ordinating propaganda with every function of the state, with industry, with education, with religion and with military power. As Hitler had done earlier they, by the close of 1940, were utilizing propaganda as a basic weapon of total war.

"BUT HOW ABOUT THE GROUND FLOOR?" points out Manning of the Phoenix Arizona Republic in scanning the U.S. national defence scene of 1940

BIBLIOGRAPHY.—Five significant volumes dealing with propaganda appeared during 1940:

Serge Chakotin, *The Rape of the Masses*. A dissertation on the psychology of totalitarian political propaganda. Specifically, it revealed how Hitler had made use of the conditioned reflex to evoke automatic, negative responses to democratic ideas and practices and who had thereby effectively stamped out democracy in Germany and seriously weakened it throughout the world.

Edmond Taylor, *The Strategy of Terror*. This was a detailed account of how Hitler's propaganda had destroyed democracy in France by accentuating religious, economic and political dissensions among the French people. Mr. Taylor wrote from personal observation of conditions in France where he had served as a correspondent.

Lawrence Dennis, *The Dynamics of War and Revolution*. Mr. Dennis saw propaganda for democracy and capitalism as futile because he saw the capitalistic system and parliamentary democracy doomed by world conditions which made collectivism an inescapable necessity.

Harold Lavine and James Wechsler, *War Propaganda and the United States*. The authors, utilizing the resources of the Institute for Propaganda Analysis, revealed the methods and goals of the propagandas of the British, French and Germans as these were directed, especially at Americans, during the war months immediately preceding Hitler's *Blitzkrieg* in western Europe.

Volume III of the publications of the Institute for Propaganda Analysis. This included analyses of various salient propagandas of the year, including Hitler's propaganda for *Blitzkrieg*, Mr. Roosevelt's foreign policy, the fifth column and the presidential campaign. (C. R. Mr.)

Protestant Episcopal Church. Throughout the year 1940 the Protestant Episcopal church, like all churches, was stirred and affected by the outbreak of paganism, brutality and ruthless aggression in this world.

The general convention undertook to raise and send a gift of at least \$300,000, and as much more as possible, to aid the Church of England in missionary work in many parts of the world. In its general work within the United States the Episcopal church made some advance in 1940, but its missionary work was gravely affected by the world conditions, especially its work in Japan and China. At the triennial convention which met in October in Kansas City, Mo., full intercommunion with the Old Catholic churches that are in communion with the See of Utrecht was ratified and membership was accepted in the World Council of Churches which was in process of organization. Although this action was strongly opposed, it was voted that the Episcopal church should become a full member of the Federal Council of the Churches of Christ in America with which the church has hitherto co-operated through its department of Christian social service.

The statistics for 1940 showed an increase in most items and a marked increase in contributions in spite of the continued financial uncertainty. The official reports showed a total of 2,171,562 baptized persons, an increase of 14,288 during the year, and a total of 1,489,384 communicants, an increase of 22,786.

Psychiatry. In 1940 psychiatrists in the armed forces of many countries were evaluating their old problems and anticipating the new ones associated with modern warfare. Sutton, writing on conscription for the U.S. navy, emphasized that the navy has no use for maladjusted individuals and that the services should no longer be considered as reform schools. Careful selection of candidates for the navy has tended to eliminate the mentally deficient, the psychoneurotic and the incipient psychotic. Mistakes are still made, however, at the time of enlistment by psychiatrists and recruiting officers, because an adequate past history of the recruit is not at hand, particularly in regard to the individual's powers of adjustment to an ordinary environment. During 1917 and 1918, about 1% of the U.S. navy was discharged each year with mental disease. It is believed that this figure could be reduced if a more complete history of each recruit was obtained.

In the warring countries the old problem of eliminating the

nervous and mentally unfit, before taking them into the armed forces, was ever present. The psychoneurotic, as pointed out by the *Lancet*, except in rare instances, has no place in the modern army. His disease is constitutional and must be recognized as such. A breakdown may result from a trivial cause with no particular strain, or the individual may only give way under prolonged and violent pressure, such as occurred at the evacuation of Dunkirk, as reported by Sargent and Slater. Whatever the cause and whatever the result, psychiatrists believe that the background and mechanism are the same, varying only in amount and degree. Susceptible individuals do not have normal recuperation power and are only capable of feeble adaption, if any adaption is possible. For the lighter cases, the margin between breaking down and being able to carry on, is a narrow one and easily crossed in either direction. More serious cases develop hysterical symptoms. Rapid recovery is often possible, but not if the soldier knows that he is going back to army life and the possibility of previously experienced, precipitating circumstances. The worth of such an individual, even if he can be returned to active duties, is more than dubious. If one could eliminate from the army all neurotic and potentially neurotic men, a few valuable soldiers would be lost, but thousands of indifferent ones and more thousands of no use at all would be removed. Malingering is not much of a problem to the psychiatrist; most evaders are quickly picked up. They, too, should be excluded from the army; a man who is willing to lie to gain discharge, is hardly likely to be a useful soldier.

The importance of sleep in the treatment of the war neurotic formerly called the "shell shocked soldier," was emphasized by Sargent and Slater, based on their experience with the British evacuated from Dunkirk. To render the patient more receptive to suggestion and exploration, persuasion and other psychotherapeutic measures, they used sodium amytal, a sedative, by the intravenous drip method, an interesting addition to the older forms of treatment.

Schizophrenia.—The attack on schizophrenia (dementia praecox) continued with unabated force. The chief therapeutic method was that of induced convulsions, using drugs such as metrazol, camphor, insulin, or by mechanical means, with electricity. All the means used have shown fair results but with marked variation in both response and in permanency. No method of treatment has been so satisfactory as to exclude the others; all have dangers and deaths or serious accidents are not infrequently reported. Dislocations of joints and fracture of bones, too, often result from the uncontrolled convulsion, caused by the most frequently used drug, metrazol. Drugs to offset the violence of the seizures, such as curare and beta-erythroidin hydrochloride, are now being tried. Notes of caution, because of this and other reasons, are appearing with increasing frequency in the medical literature. Kwalwasser believed his results with metrazol were poorer than with psychotherapy; Whitehead warned against irreversible changes in the brain; other investigators found the metrazol results disappointing, while insulin treatment gave somewhat better figures. Of the various forms of drug treatment, insulin, the original Sakel preparation, appeared to give the best results. The results, however, are increasingly less satisfactory, for fewer permanent cures are reported year by year. An unusual complication of insulin treatment occurred in the warring countries; rationing reduced the amount of sugar allowed in Britain to less than 1 lb. a day, an amount needed to terminate coma. McGregor reported that a substitution of potato soup was satisfactory.

Electric shock treatment for schizophrenia, based on the original work of Cerletti and Bini in Rome, giving a single convulsion at a time, which may be repeated, is at present much favoured. Many of the uncontrolled factors of drug-induced seizures are

eliminated. The result of treatment by this method appears to be about as valuable as by other means. The treatment, as pointed out by Fox, is still in a preliminary stage of investigation. All forms of shock therapy are being used for various psychotic disorders, such as depression stupor and agitated melancholia, as well as schizophrenia.

In the depression states, particularly with agitation, the original work of Moniz on surgical destruction of the association pathways of the frontal lobes, called prefrontal lobotomy, was finding increasing acceptance among psychiatrists. As more cases are reported and longer intervals are recorded after operation, this procedure, considered so radical a few years ago, is becoming recognized as a valuable method of treatment in selected individuals.

Drug Addiction.—The effect of marijuana, an extract of the hemp plant and used in cigarettes as a drug, has been investigated by Walton, Adams and others. The drug is used extensively throughout America; in India 12% of all admissions to the Bombay mental hospitals in 1937 were the result of taking hemp in some form. Its general effect on humans is to weaken the will, but it is believed that marijuana seldom, if ever, makes the individual so weak, as popularly alleged, that he will commit rape, suicide or murder. The drug, moreover, is not strongly habit-forming and most psychiatrists now believe that taking it does not lead to sexual or other violent crimes. Drug addiction, in general, moreover, according to Lindesmith, is not often associated with serious crime, but an extensive "mythology" has grown up around this idea.

Lindesmith "debunks" many concepts fixed in the popular mind, when he says:

Most violations by drug users consist of violation of the narcotic laws and petty offences; there are no truly reliable signs of drug addiction; the steady use of opiate drugs produces virtually no known significant pathological symptoms, aside from the addiction itself; few addicts become moral degenerates and those from secondary causes; not a few successful, professional and business men are addicted to drugs and take them without signs of mental deterioration for years, provided their supply is adequately maintained by a physician; punishment not only leaves a stigma, which carries over to the social and vocational life of the individual, but extends his acquaintance with drug users and peddlers. (See also NERVOUS SYSTEM.)

Psychical Research. Studies of telepathy, clairvoyance and precognition, generally included under the heading of "Extra-Sensory Perception" or "ESP," were during 1940 characterized by two features. One is the resurgence of ESP experimentation in the psychical research societies, both in America and in England. The other is the appearance of new evidence for precognition on both sides of the Atlantic.

In the United States there appeared further evidence of ESP. Two Columbia psychologists, Dr. Gardner Murphy and Ernest Taves, conducted card-guessing tests in the laboratory of the American Society of Psychical Research in New York. Various types of cards and symbols were used—some with two choices,

some with as many as 14. The most successful results were achieved with the 14-choice tests.

From Duke university came in 1940 two reports offering a further advance on the hypothesis of precognition or foreknowledge. These experiments were based upon the prediction of the order of ESP cards in a deck which will be shuffled or selected mechanically. One of these reports was by Dr. J. B. Rhine, and another, a thesis for the M.A. degree, by Miss Lois Hutchinson. Both authors hesitated to conclude that precognition is established, but regarded the evidence as increasingly favourable.

In spite of the war, England was the source of two reports of experiments in ESP. The first was by Whately Carington, who tested the ability of a large group of subjects in different parts of England and America as to their ability to reproduce drawings which he "exposed" in his study in a scheduled order. The drawings were chosen by random methods and the reproductions by the subjects were, along with the original drawings, turned over to a judge whose task it was to match them. He found that they matched to a better-than-chance degree. The fact that the subjects more often hit a drawing that had been exposed before or later than the one at which they were aiming at the time represents the outstanding feature of these experiments. This is called a "displacement effect."

The same effect was reported by S. G. Soal who was invited by Mr. Carington to look for the phenomenon in his card-guessing data. These data had been obtained by Mr. Soal in tests in which the subject had been asked to identify ESP cards (with five symbols: star, waves, square, plus and circle) which were held and looked at, one at a time, by an agent or sender screened from the subject's view. Again it was found that the subject's calls corresponded much better with the just-preceding or just-succeeding card than with the actual card he was attempting to call. This systematic scattering is itself a problem for further investigation.

An important summary and review of the experimental evidence on extra-sensory perception appeared during 1940 in the volume *Extra-Sensory Perception After Sixty Years* by Rhine, Pratt, Stuart and Smith of the Parapsychology laboratory, and Greenwood, a mathematician, of Duke university. (See also PSYCHOLOGY.) (J. B. R.)

Psychology. The trend in modern psychology of giving as much attention to peripheral regions as to its own central areas continued during 1940. Thus on the physiological front psychologists were concerned with the effects of drugs and hormones, with the characteristics and correlates of the electroencephalogram (brain waves), with the results of the destruction of parts of the nervous system, and with the functioning of the sense organs. On the border line, where psychology meets the social sciences, problems of public opinion, propaganda, group conflict and the socialization of the child received the most consideration. Dispersed as were their labours in attacking the biological and social aspects of mind, psychologists did not abandon exploration of their traditional subject matter of learning, motivation and perception.

Motivation and Learning.—Modification of behaviour through learning again held the centre of the psychological stage. The important books of E. Hilgard and D. Marquis, C. Hull and G. Katona made available advances in research and theory. *Conditioning and Learning* is a critical summary of the experimental work on conditioning in relation to various aspects of the learning process. Hull's *Mathematico-Deductive Theory of Rote Learning*, a specialized treatment of associative learning, gives his system of 17 postulates, 54 theorems and 110 corollaries concerning serial position effects, reminiscence and forgetting, reaction

APTITUDE TEST conducted at Stevens Institute of Technology, Hoboken, N.J. After studying a set of designs for 12 seconds, the subject draws them from memory

thresholds and the curve of memorization together with their mathematical proof and degree of experimental verification to date. In contrast Katona's Gestalt emphasis in *Organizing and Memorizing* gives the central role to meaning rather than to mechanistic association. Katona marshals evidence to support the thesis that the understanding of organized wholes is the prototype of learning. On the whole, interest attached more to the motivating conditions underlying learning than to the mechanics of learning. The work of Gulliksen in seeking the exact equation of the learning curve with motivation held constant was being supplemented by experiments which measure the precise relation between amount of reward and degree of learning. Such experimentation showed that the rate of extinction of a learned act decreases as the amount of the original reward increases. Variability of reward has also been tested in the animal laboratory and the finding is that constant amounts of food, even though small, are more effective than variable amounts of food which half the time exceeded the constant reward.

An interesting motivational problem related to the externalization of such organic drives as hunger and sex. A whole theoretical structure has grown up on the assumption that the means to satisfy a drive become in time drives themselves. This notion of the functional autonomy of motives regards the internal drives as important only in the early years of life and insists on the independence of adult social goals as powerful incentives. Older experimental work failed to support the theory. For example, apes taught to work for chips, exchangeable for food through a machine, accumulated chips as long as they knew the chips had exchange value. But when the machine yielded no more food the apes lost their interest in working for chips. It was shown that rats, rewarded for learning a maze with food, learned a new maze without reward as rapidly as a control group of rewarded animals. Other evidence indicated that the means can turn into drives under certain conditions, the most important of which is the tying in of an additional source of stimulation to support the original habit or means employed. The functional autonomy

of motives is thus more apparent than real.

Increasing attention was being given in the field of motivation and emotions to extreme excitement produced by frustration and conflict. In laboratory situations animals, when frustrated or forced to make a difficult if not impossible choice, will go into fits and sometimes into cataleptic states. This experimentally-produced neurosis is often regarded as the analogue of human nervous breakdown under conditions of stress and strain. It was hoped that work on the experimental neurosis might lead to a better understanding of the conditions of conflict responsible for nervous disorder and of the reactions to conflict which preclude breakdown. That the gap between neuroticism of the laboratory rat and the psychoneurosis of the human is great is indicated by the experiment of C. R. Adams. Human subjects who made neurotic scores on personality tests showed no greater susceptibility to frustration of a laboratory sort than stable subjects. Animal experimenters, following in the trail blazed by Liddell and the Cornell group, reported these conclusions:

(1) In rats the neurotic pattern is in good part an inherited affair. (2) If in conflict situations the animal can make some abortive response (a response which does not solve the problem but takes him out of the situation), he does not develop the neurotic pattern. (3) Measurable precursors of the final breakdown can be found in the activity level of the animal, startle pattern, respiratory changes and latency of response to the conflict situation. (4) The clinical dichotomy between normal and neurotic omits the quantitative gradations of behaviour which are related to degree of conflict or frustration and can be so studied in the laboratory.

The inheritance of temperamental differences in rats was confirmed by another investigation in which two strains of rats were selectively bred for seven generations. The animals of the emotional strain defecated and urinated frequently in test situations; the animals of the nonemotional strain showed few or no excretory reactions. Further study indicated that the emotional rats tended to be less aggressive, more active and slower in problem solution than the nonemotional rats.

Method.—A significant development during 1940 was the application of Fisher's principles of factorial design to psychological problems. The logic of this method utilizes the mathematics of small numbers and controls variability by the rigid design of the experiment in which variables are paired in an overlapping manner. Factorial design is particularly applicable to many psychological problems which present a large number of variables, which in older experiments were controlled only by the use of large numbers of cases—often an inadequate control in that selective errors are very common in working with human variables. Lindquist's volume, *Statistical Analysis in Educational Research*, translated Fisher's technical work for the average experimenter. Interest in the possibilities of the method, as evidenced by the round table on the subject at the annual meetings of the American Psychological association, presaged a revolution in the planning of psychological experiments.

Physiological Psychology.—The electroencephalogram, the electrical activity of the brain as recorded through the intact skull and scalp, showed characteristic changes from active waking states to sleeping states and in general from normal conditions of the organism to abnormal conditions. The recording of brain waves in relation to various psychological factors has become a standard type of experimentation. There is no constancy in individual pattern of brain rhythm between waking and sleeping states. The person who varies from the group in his waking encephalogram is not necessarily the individual who varies from the average in his sleeping encephalogram. The average adult pattern of alpha waves, moreover, does not appear consistently until about the age of eight or ten years. In another investigation, differences were found between the electrical brain activity of a group of normal and a group of behaviour-problem children. In general, however, the tendency is to break down the characteristic brain waves into their component elements to find out more about the real nature of these gross electrical records. Thus Bartley reported that electrograms of the rabbit's optic cortex reveal a specific cortical response to peripheral stimulation. This response does not so much block the alpha rhythm, as is some-

times assumed, as it disperses the activity rest-cycles of the alpha elements under conditions of constant or nearly constant visual stimulation. The alpha activity is not abolished by properly timed intermittent stimulation.

Upon the older foundation of knowledge concerning the general functions of major parts of the brain, newer techniques of extirpation and experimentation were building a detailed account of specific brain areas. Following are some typical findings: removal of the visual cortex in monkeys destroys daylight or cone vision leaving the animal with twilight or rod vision. Loss of the visual cortex does not prevent discrimination of flicker under conditions favouring brightness adaptation. Ablation of both frontal lobes, as Jacobsen demonstrated, destroys ability to solve problems involving immediate memory of several items, but Finan reported that operated animals, with the frontal or associational areas extirpated, can learn delayed discrimination if rewarded in a trial-and-error situation. Small lesions of the cerebral cortex do not change the cortical inhibitory function sufficiently to produce emotional behaviour. Similar lesions do not produce regressive behaviour, the return to earlier and less discriminating responses. Cortical injury must be fairly great to bring about the uninhibited emotional activity of the thalamic centres.

The study of the special senses, once the staple problem of the psychological laboratory, has become a highly specialized field since the development of elaborate electrical equipment for controlling stimulation and for recording responses. Phenomenological description and introspective protocols have given way to detailed study of physiological processes. Wever and Bray continue to apply their method of recording the action potentials from the auditory nerve and the cochlea to the study of auditory phenomena. In an investigation of combination tones through the electrical responses of the cochlea they found that two pure tones gave rise not only to their own harmonics but also to the sum and difference combinations of the two stimuli and their integral multiples. The summation tones had equal status in the response pattern with the difference tones and hence can not be regarded as difference tones of a higher order. The beat-tone theory and the overtone theory of difference tones must thus be discarded in favour of a transformation theory which emphasizes distortion in the inner ear. Investigators at the State University of Iowa were interested in the perception of human speech patterns which are rarely of a constant pitch even for short intervals. Hence they measured the relation between the perception of pitch and the rate and extent of frequency modulation in short pulses of sound. They found that the greater the change in extent of frequency modulation the greater the perceptible change in pitch, but the more rapid the rate of frequency change the less the perceptible change in pitch. Another type of approach is exemplified in the work of Neff who sectioned various amounts of the auditory nerve and then tested hearing. Very small lesions produced no demonstrable effect. Larger lesions caused a marked loss of hearing at the upper frequencies, but the lesion had to be very extensive to interfere with perception of low tones. In no case was there a loss for low or intermediate frequencies without greater losses for the high frequencies.

Social Functions.—A genuine advance in the psychology of social relationships has been the growth of neo-Freudianism. Disregarding allegiance to the Freudian system as an ideology, the neo-Freudians have concentrated on solving the problems, to which Freud called attention, on the basis of observation and research. In the course of this movement psychiatrists like K. Horney have contributed clinical observations on the relation of culturally-produced anxieties to personality development, experimentalists taking their cue from the Yale group have been putting concepts like regression and repression to laboratory test, and ethnological interpretation like that of Kardiner has been developing the functional basis of customs and institutions in the tradition of Malinowski.

Studies of regression showed that when animals are frustrated in their attempts to solve a problem they will fall back upon responses learned earlier as a solution to a simpler problem. Careful experimentation, however, failed to substantiate the notion of regression to earlier habits in a crisis situation as an invariable principle of behaviour. Regression to an earlier habit is in large part dependent upon the potency of the motivation under which this habit was learned. Laboratory evidence thus confirmed the Freudian doctrine that the early overfixation of the libido at a given developmental stage determines the type of regressive behaviour the individual will show when balked in adult adjustment. The importance of developmental history for later behaviour is also seen in Hunt's work on feeding frustration in infancy. A group of rats, limited in their feeding for 15 days during infancy, exhibited much more hoarding behaviour when put on controlled subsistence as adults than a control group not subject to feeding frustration during infancy. Another group, subject to similar feeding frustration at a later period in infancy, showed no carry-over in hoarding behaviour as adults.

Repression of ideas productive of anxiety was tested by Sears with two groups of subjects learning different lists of paired terms. The one list contained words judged by analytically-trained psychologists to be anxiety-inducing for most college students; the other list on the contrary contained words of gratifying connotations. No difference in recall was found either after 48 hours or three weeks. Clinical observation of memory loss due to repression still lacked conclusive experimental proof. Evidence for the Freudian hypothesis of displacement was at hand, however, in the study by White and Lewin of the effects upon children of democratic and autocratic group atmospheres. Hostility between group members decreases as hostility to outsiders increases; as hostility to the adult leader builds up, aggression among child members grows less; and expression of hatred toward an impersonal object releases tension developed toward a personal hate object. The Freudian doctrine that emotions are characteristically displaced on objects and persons, not the primary causal agents of the emotional arousal, has wide implications in problems of mass psychology.

Kardiner's description in his *The Individual and His Society* of two primitive cultures in terms of the interaction between the developing child and specific institutional pressures, especially familial, gave the student a genuinely dynamic account of personality. By replacing the orthodox Oedipus complex with an emphasis upon the child's dependency upon adults, Kardiner made possible a fusion between the psychology of the laboratory and the Freudian interest in the socialization process. Additional anthropo-

logical evidence came from Dennis' study of the Hopi child. Dennis bore out Malinowski's observations that resentment of authority and discipline rather than sexual jealousy is the main determinant of hostile attitudes which children develop toward adults. Hopi children faced with fewer prohibitions and frustrations are much less given to crying than American children. On the other hand the notion that feeding-frustration leads to thumb sucking and other nervous oral habits was definitely challenged by Hopi children who show such behaviour even though breast fed to the age of four.

Propaganda and Public Opinion.—Paralleling the interest in developmental questions was the attention given to public opinion and propaganda. Techniques for the measurement of public opinion were improved through the interaction of three types of research: the public opinion polls, commercial marketing investigations and the attitude experiments of the social psychologist. The public opinion poll showed the superiority of the interview over the mail ballot and otherwise improved methods for accurate sampling. The commercial researchers added practical insight into question wording and interview procedure. The psychologists stressed the intensity and motivation behind the expressed attitude. A product of the fusion of techniques is found in *Radio and the Printed Page*, one of the volumes summarizing the findings of the Princeton radio project, in which the psychological advantages of the medium of print over the radio for popular education are documented.

Trends in public opinion were being examined in relation to critical events and propaganda in a more systematic fashion than ever before. Representative cross-sections of the public were being polled regularly with standard tests. Psychological analysis of propaganda followed two lines of investigation: (1) collection of propaganda materials and their interpretation according to accepted principles of suggestion and emotional belief and (2) experiments on changes of attitude with different types of appeal and with various prestige accompaniments. The *Public Opinion Quarterly*, which completed its fourth year, was becoming more and more the meeting place for the public relations expert, the political scientist and the social psychologist. (See also PROPAGANDA.)

During 1940 appeared the first yearbook of the Society for the Psychological Study of Social Issues, a group organized in 1936 for the purpose of bringing psychological techniques and interpretation to pertinent social problems. The volume deals with industrial conflict and shows the role of attitudinal factors in clashes between employers and employees and between various groups of the workers themselves. (See also NERVOUS SYSTEM; PSYCHIATRY; PSYCHICAL RESEARCH; PSYCHOLOGY, APPLIED.)

Psychology, Applied. Applied psychology during 1940 gave striking evidence of the way in which war and preparation for war had invaded the lives of men everywhere. The usual ready interchange of technological information between countries was interrupted by censorship and by the difficulty—often impossibility—of sending technical journals through mail services that were badly overtaxed. What information did cross borders left little doubt that, the world over, those who had technological training in psychology were either already at work upon military problems or were holding themselves organized in readiness for such service. One commentator pointed out that applied psychology had celebrated its first birthday during the war of 1914-18 and that it had reached its majority during the international disturbance which began in 1939. Certain it was that many of the same psychologists who served in the World War of 1914-18 found themselves engaged for the second time in military service.

There were, however, striking differences between the two occasions, for many of the central techniques employed as routine in 1940 were unknown in 1918. The construction of tests, for example, leaned heavily upon correlational and factor analysis methods developed only since 1920. Statistical methods for deal-

ing with small samples made it possible in 1940 to investigate fields in which it was necessary to make statistical comparisons between small groups—a hopeless task in 1918. Techniques developed in industry for the selection, classification and training of individuals in skilled occupations were taken over bodily by the military establishments. In fine, where governments during the war of 1914–18 had been compelled to place most of their technological problems in the hands of those who had training only in “pure” psychology, there were available in 1940 specialists trained in dealing with practical psychological problems and armed with tested instruments and techniques suited to the problems before them.

Wartime concerns of psychologists were not, however, limited to dealing with questions involving the armed forces. Problems of civilian morale and of the analysis of propaganda fell within the proper scope of methods developed since the war of 1914–18. The techniques of the public opinion poll and of attitude-measurement were directly applicable to the study of public responses during wartime. With audiences running as large as 80,000,000 listeners to a single broadcast in the United States alone, the radio proved a natural object of study. A number of commercial organizations were sponsoring different ways of measuring the size of the listening audience. Centres for the analysis of broadcast content were established and arrangements were made for 24-hour listening posts to analyze short-wave broadcasts from other countries. The introduction of this new and powerful weapon for propaganda among civilian populations brought the problem of morale to the fore and re-emphasized the wartime use of psychological techniques developed in times of peace.

Accidents.—Although many of the published reports dealt with researches completed before the beginning of the war, there were already in print by the end of 1940 articles which pointed to the importance of accident-reduction during wartime. Analyses made in many countries agreed in demonstrating that accidents are not distributed through the population by chance but that a small group of accident-prone individuals continued to incur far more than its expected number of accidents. There have been many efforts to construct tests and batteries of tests to detect these individuals in advance but these have met with only mild success. They make it possible to reduce the accident-rate in commercial concerns which hire employees from a large pool of available personnel but are not of much help in deciding which automobile drivers to license, for example. In part, at least, this is due to the very complex causation of accidents and, in part, to the unsatisfactory reporting of accidents that characterizes the civilian population. One statistician reported a technique for arriving at the best possible prediction to be made from any such set of data and indicated that the best possible battery of tests for the accident-data under consideration could not reduce the error of estimate by more than about 10%.

Particular efforts were directed towards reducing the accident-rate in defence industries and on the highway. Changes in highway design had been shown to be of value only as they eliminated possibilities of errors in human judgment and performance. During 1940 there were reports of investigations dealing with improvements in headlights and in directional signs, all concerned with reducing the possible range of human failure. Other publications dealt with researches on the known causes of accidents, including such factors as alcohol, glare-sensitivity, age, fatigue and personality defects. The added strain of living under wartime conditions served only to emphasize the necessity of making provisions to eliminate every possible cause of accidents in the factory, on the highway and in the home.

Aviation.—Informal reports from all of the larger countries left no doubt that the selection, training and maintenance of

aviators was a principal concern to applied psychologists during 1940. The fact that much of their research was being conducted under military auspices and accordingly not for general publication sharply curtailed the number of published articles in this field. Even so, the technical journals carried accounts of investigations in progress from Germany, England, Italy and the United States.

Experiments on the effects of reduced oxygen uniformly pointed to the harmful psychological effects of high-altitude flying without an oxygen mask. It was shown that lack of oxygen above critical altitudes resulted not only in reduced skill in handling the controls but brought about as well impairments in judgment which were not less serious. These effects were found to shade over into complete loss of consciousness in higher altitudes.

There were studies of the “black-out” under heavy deceleration such as is encountered in dive-bombing. Special efforts were made to develop tests to differentiate men according to their suitability for the specialized tasks of military aviation. The broadest approach was being made in the United States, where more than 20 universities were co-operating in a program of research sponsored by the National Research Council in connection with the training of more than 50,000 aircraft pilots under the Civil Aeronautics administration. Topics of investigation in this program ranged from the initial selection of pilots through to the study of their behaviour in the air and involved for the first time the objective recording, during flight, of the responses and reactions of novice pilots.

Industry.—The year in industrial psychology was characterized by emphasis on the social aspects of employment. The term “job satisfaction” appeared as the central concern in many articles and there was published a handbook which dealt entirely with studies of industrial conflict. There were additional reports dealing with the necessity of adjusting the formal organization of an industrial plant to take account of the informal social organizations that spring up spontaneously among the workers. The representative of one industrial concern reported that his company had found it valuable to set up a counselling system to bridge the gap between formal and informal organizations. Informal reports were available from other companies which were supporting further intensive studies of such organizations within their plants. Upon this general background, one organization reported that time and motion study techniques, usually opposed bitterly by organized labour, could be used profitably under collective bargaining, provided the workers involved retained a power of veto and a provision for individual adaptation.

Military.—The very nature of the investigations in this field operated to keep much of the research under way from being reported. In spite of the pressure for secrecy, there were published reports from at least five major countries. Two ominous articles from Spain dealt with the vocational re-adaptation of those crippled by war. It was known that psychologists in all of the larger countries were being asked to aid in the selection of those best suited for military service and in the classification of these men for specialized duties within the armed forces. A report was available on military selection during the Spanish war. From England came a reminiscent summary of studies conducted in 1915–18 on problems of selection and maintenance of personnel in munitions factories. In the United States a committee representing all of the national psychological organizations was formed to make the professional services of their members available to the government during the international emergency.

Vocations and Occupations.—Researches continued to point to the wide disparity between occupational opportunities and occupational choices of adolescents, their choices showing a tragically heavy weighting towards the “white collar” occupations. There was increasing emphasis on the necessity for broad-scale and long-time programs in vocational orientation. One important step in this direction was the publication by the United States department of labour of a dictionary of occupational titles, containing titles and summaries of duties for more than 18,000 jobs. This makes possible considerable gains in “horizontal classification”—a classification of jobs in terms of their psychological requirements, cutting across arbitrary occupational boundaries. (See also *PSYCHOLOGY*.)

Public Health Engineering. **Air Sanitation.**—With increasing knowledge of the bacteriology of the air of occupied rooms has come a more general acceptance of the once discredited view of air-borne infection. Public health thought appears to be, "air-borne infection is possible, probably does occur, but how often, and how widely?" Cruickshank and Muir, for example, observed a secondary streptococcal infection in a military hospital ward and concluded, after elimination of other possibilities of spread, that the infection was in fact air-borne.

In the home, one offset to air-borne infection is natural ventilation by means of flues and exhaust ducts, or even by leakage through windows, doors and walls. Ventilation, expressed as number of air changes per hour, is measured by adding gas, such as hydrogen, and noting the rate of its disappearance.

Experiments by Warner have shown so simple a device as a flue or air grating will ordinarily provide between one and two air changes per hour, while with flue tightly sealed, the ventilation due to leakage is 0.8 change per hour. These volumes depend upon size of rooms and of flue opening, wind velocity, outside temperature and tightness of windows and doors. The recommended standard—a minimum of 600 cu.ft. of fresh air per hour per occupant, may readily be obtained by flues, without fires, or by air gratings of proper size.

A result equivalent to ventilation brought about by some germicidal treatment may be conceived. Wells thus defines sanitary ventilation. Ultra-violet light is still being tested experimentally under an increasingly wider range of conditions. Other methods of room disinfection are likewise under investigation. The employment of "aerosols," fine mists of a liquid disinfectant, has received attention, especially in England. The effects of normal daylight and sunlight within homes is being investigated from the same point of view at Columbia university, with significant results.

Housing.—Man's two prime requisites are food and shelter. The political crises of 1940 brought both these matters into sharp focus. Air-raid shelters and bombed homes present new problems to the health authorities: problems of emergency crowding and of environmental sanitation under extreme conditions. Perhaps nowhere in the entire field of civil government have the advantages of preparedness been better exemplified. Through study and research, sanitarians are possessed of far more knowledge of the causation and prevention of diseases than it has yet been practical to teach or to employ. They are thus prepared to fulfil their obligations under conditions of stress. Despite scant information, important dividends are being paid in the form of lives saved, upon past investments in the field of public health.

In the United States the problems are rather those of new housing developments in relation to expanding war industry. In this instance also, the knowledge of the past is being heavily drawn upon, and emergency housing is merely the application of well thought out principles of good housing under normal conditions.

Water Supply and Sewerage.—Chlorination of water supplies has become a well-nigh universal treatment. Objectionable taste and odour have at times hampered its proper application. Various remedies have been proposed and in particular overchlorination has been avoided. A more satisfactory procedure is now available in the newly-developed "break-point chlorination." This goes to the opposite extreme. Increasing dosage increases residual taste up to a certain point, the break-point. At that point chlorine demand suddenly drops, the tastes and odours disappear.

A new water supply problem is posed by recent studies relative to poliomyelitis. The virus is recoverable from the stools of patients, convalescents and healthy contacts, and from city sewage below epidemic areas. The disease may be given to certain species

of monkeys by the oral route.

What meagre information there is on the life history of the virus outside the body indicates that it would be adequately controlled by ordinary pasteurization procedures in milk and that it is killed by concentrations of chlorine in water somewhat greater than those commonly employed. With no suggestion that water or milk carriage is a common mode of transmission during epidemics, these newer discoveries do place added responsibility upon water supply authorities.

The water supply of an army, whether in fixed camp or on the march, is a pressing problem in military engineering. To supply water in a fixed army post calls merely for an adaptation of the principles of town supply. More critical are the problems of the army on the march or in temporary field quarters. In the latter case 25 to 35 gal. (U.S.) per man is considered necessary in the American army; in the former, two gallons is an adequate allowance. A mobile purification unit weighing about 700 lb. and having a capacity of 12 to 15 gal. per minute was used in the 1940 army manoeuvres with every satisfaction. It employs filtration through sand and hypochlorination.

Aviation and Disease Transmission.—The shortening of time schedules and extension of continuous flight routes by aeroplane present new problems to the health administrator. One of these is the danger of introducing a case of a disease during its incubation period. In yellow fever, for example, the incubation period of six days guaranteed that exposure in a foreign port would develop en route and be reported on arrival. Now infected contacts may develop after arrival. Quarantine regulations must keep all suspects under surveillance for the full incubation period. A second problem relates to the importation of live mosquitoes, possibly infective. An examination of 398 planes arriving at the port of Miami, Fla., in 1938, disclosed a total of 651 insects, of a dozen or more genera, including five live and 40 dead mosquitoes of many species. The sanitary control of the area about the airport includes measures against mosquito breeding facilities.

Public Health Services. In the development and expansion of public health services in the United States of America, it is not the aim of the federal government to undertake medical care in the sense of abolishing the free practice of medicine and bringing it under federal control, *i.e.*, in establishing so-called "state medicine"; but rather to reach an arrangement, under the democratic form of government, whereby not only full public health protection, but medical and hospital needs as well, of all the people can be met. This aim was fully endorsed by the American Medical association as set forth in its platform announced in 1940. With the sombre shadows of war darkening Europe, little advance in public health activities was recorded in European countries during 1940, except the changes in and the intensification of such measures as were necessitated by war conditions. At the same time, conditions unfavourable to health became increasingly serious. Prior to the outbreak of the war, many of the small invaded nations had modern and progressive health organizations. Of the fate and activities of these organizations in 1940, little is known.

Great Britain.—Before the beginning of the war in western Europe, the mobilization of medical and public health services had already begun in Great Britain and France. The general health conditions in these countries had never been better. Health authorities of Great Britain state that, although the war had an accelerating effect on efforts made to protect and improve

the health of the people, the satisfactory health situation after several months of war was attributed more to effective public health services during the years preceding the war than to the care exercised since the war began.

France.—The call of physicians to military duty in France before and during the war, left many towns and country regions without medical services. In meeting the health problems created by the war, the French government, before the armistice, in 1940, undertook the extension of health services by means of especially equipped trains of 16 to 18 coaches each, designed for rapid application of prophylactic measures to large numbers of persons, both evacuated civilians and the military.

Finland.—As the result of recent studies, endemic goitre is believed to be a national problem in Finland. The characteristic feature of the disease there is the high frequency of adenomatous thyroids, demonstrated in nearly 100% of the cases. Universal prophylaxis is not to be undertaken, however, until further observations have been made of the results, in later adult life, of iodine prophylaxis in childhood in Switzerland.

Germany.—Early in 1940 Germany adopted regulations for medical practice during the war, including the establishment of physicians' fees. This was stated to be a war measure, however, and did not indicate the intention of the government to socialize the profession.

As in Great Britain, diphtheria immunization has not been sufficiently general in Germany to achieve outstanding results. In fact, diphtheria morbidity and mortality have been increasing there since 1933, although the case fatality rate has declined. In 1933 there were 75,000 cases of diphtheria in Germany, as compared with 150,000 cases in 1939.

Italy.—The minister of health of Italy issued a circular in 1940 regarding the control of communicable diseases, setting forth the measures to be employed and establishing the period of quarantine. Since anti-tuberculosis centres were established in Italy in 1927, the death rate from tuberculosis dropped from 147 per 100,000 to 80. Similar declines in the disease, however, were also reported from most other countries. In 1939, the Italian social insurance covered both insured workers and their families, and 57,000,000 days of hospitalization had been given during the first 10 years of this insurance plan. Late in 1939 a law was adopted in Italy prohibiting persons having a contagious disease from entering domestic service. All such servants must pass a medical examination (free) at specified intervals.

Rumania.—In Dec. 1939, the minister of health of Rumania appointed a technical committee to study public health problems and make recommendations regarding urgent matters needing attention. Besides specific diseases, the subjects include malnutrition and deficiency diseases, maternity and child welfare, eugenics, and dental conditions.

Australia.—During 1940, the commonwealth and state health authorities of Australia conducted a national health educational campaign through the press, radio and cinema, supported by the local branches of the British Medical association, the especial object of which was to inform the public of the preventive and curative medical services available and to stress the importance to the nation of preserving a high individual health standard. An amendment was passed in 1940 making more strict the laws governing abortion. Contract medical practice as a private enterprise, initiated by physicians on the community plan and voluntary basis, was begun in Australia in the latter part of 1939. The proposal for national health insurance was abandoned in Australia in that year.

New Zealand.—New Zealand, with slightly more than 1,000,000 population, experimented with socialized or state medicine, under the control of the department of health, which administers the Social Security act of 1938. This act provides for medical treatment and hospital care and "such other benefits as may be necessary to maintain and promote the health and general welfare of the community." The benefits are available to all persons. Funds for certain health purposes are raised by local charities.

Canada.—In Canada, efforts were made during 1940 to strengthen and expand official public health agencies. Many private and voluntary health agencies were discontinued, having been deprived of both workers and financial support as the result of the war. With the need for new economics, public health services were being reevaluated, accompanied by an extra effort to avoid the lessening of fundamental health activities.

U.S.A.—In the United States of America, the federal government, through the Public Health service, continued federal aid to the states in strengthening and expanding their health organizations. In research, a protective vaccine against epidemic typhus fever was developed which proved successful in experimental animals and the possibility of developing effective immunization against pneumonia was demonstrated; tularemia infection was found in Montana streams, and poliomyelitis was induced experimentally in a species of rat and the white mouse, thus providing cheap experimental animals for poliomyelitis research. A research unit in gerontology was organized at the National Institute of Health in 1940, which will conduct studies on the biology of senescence and on diseases, mental and physical, characteristically associated with advancing age.

Non-profit voluntary medical care programs were being tried out in several cities, and various group hospitalization schemes were in effect throughout the United States. Experience with these programs shows that frequent changes have been necessary in fees and the limitations of services.

Increased activities were recorded in the state health departments in industrial hygiene, venereal disease, cancer, tuberculosis and pneumonia control programs.

Voluntary medical care programs for low-income farm families, instituted in 1936, by the Resettlement administration in co-operation with the state medical societies, covered nearly half a million individuals in 1940. A federal bill authorizing six annual appropriations of \$10,000,000 each to

provide hospitals in rural and economically depressed areas was reported favourably during 1940 but was not brought up for vote.

The principal advances in public health services in the Latin-American countries of the western hemisphere during 1940 were represented by the strengthening of health administrations, the increase in the number of trained personnel, the promulgation or modernization of sanitary legislation, the increase in hospital and research facilities and the increase in health budgets. There was also a definite tendency to provide greater stability of tenure for health officials. One indication of the effectiveness of improved sanitary services in the Latin-American republics is the general freedom of all important sea- and airports from pestilential disease during 1940 permitting unrestricted communication among all countries of the western hemisphere.

Public Utilities. Early in 1940 (Feb. 28) the Securities and Exchange commission began its long-awaited action in issuing "show cause orders" for the integration of holding companies in conformity with section 11 of the Holding Company act, the well-known death sentence section. Nine of the larger holding company systems were required to file statements and plans as to their position and steps to be taken in conforming to the provisions of the act, which limited operations to "a single integrated public utility system and to such other businesses as are reasonably incidental or economically necessary or appropriate to the operation of such integrated public utility system." Corporate assets involved in these activities were estimated to exceed \$14,000,000,000. It was certain that these efforts on the part of the commission to make headway on its most important and difficult assignment would provide grist for its administrative mill for years to come. The details to be encompassed were technical in an engineering, legal and financial sense; they were individual to each property and the result of historical growth; they could be ascertained only upon painstaking investigation because the facts were often obscure and their economic implications in relation to the legislative standard imposed were only dimly perceived by those who drafted the law and by its legislative sponsors. If the sprawling holding company systems operating through many states were to receive permission to operate more than one integrated system, they must be prepared to show that each additional system could not be operated as an independent system without loss of substantial economies and that their common control did not impair localized management or the effectiveness of regulation. The task would prove a severe test of the efficacy of the administrative machinery.

Federal Communications Commission.—During the year 1940 the Federal Communications commission supplemented its earlier report favouring integration of domestic telegraphic communications with a similar favourable report recommending merger of international telegraph service to embrace both cable and radio facilities. The report was addressed to the Senate Interstate Commerce committee in connection with a study of the entire telegraph industry. The commission was unanimous in suggesting complete monopolization of the domestic business, but divided on the international end, the minority contending that the complete abandonment of competition between cable and radio services would retard technical advances. The majority, however, was convinced that national interests in defence and in providing a more effective device for securing equitable communication arrangements with foreign administrations would be best served by the merger method.

Federal Power Commission.—The United States supreme court handed down the most significant decision affecting the respective jurisdiction of the states and of the Federal Power Commission over navigable waterways in many years. In the Appalachian Electric Power company case, the majority of the court over two dissenting justices held that even though a river is not navigable naturally and no improvements are contemplated, the river may be classified as navigable if it can be made so by "reasonable improvements." Under the interstate commerce clause the authority of the federal government is not limited merely to considerations of navigation, but flood control, watershed development and recovery of the cost of improvements through utilization of power are likewise to be considered as a part of control over interstate commerce. Riparian owners' rights and the powers of state legislatures, 41 of which had joined the power company in fighting the Federal Power commission in its attempt to compel federal licensing, were thus made subordinate to the federal "domination over the water power inherent in the flowing stream."

National Defence.—The requirements of the national defence program for power occupied the centre of attention during 1940. With the growth in power demands for the munitions industries, private enterprises as well as public agencies were expanding their power facilities. With 1,850,000 kw. of capacity installed during 1940, the power industry was looking forward to further expansion in excess of 4,000,000 kw. during the ensuing year. A record-breaking output of 144,600,000 kw.hr. was achieved during 1940, with the maximum weekly output exceeding by 60% the maximum weekly output for the year 1929.

Federal Projects.—The incidence of the national defence program could be observed best in connection with federal projects, particularly in the appropriations recommended by the president. The TVA was allotted the giant's share with a total of \$76,484,000 in reappropriated earnings, proceeds from bond issues and a federal appropriation of \$69,800,000. This project, with current completions of three dam projects, was operating a even-dam system of its own construction, was proceeding with the construction of three additional dams on the navigable portion of the Tennessee river, a new storage project on one of the upper tributaries and a new team plant to firm up secondary power.

In the Pacific northwest there was completed and energized during 1940 a 235-mi. transmission line connecting Bonneville dam with Grand Coulee dam at a cost of \$4,000,000. Federal budget estimates allotted \$7,170,000 to the army engineers for additional generator installations at Bonneville dam and \$12,958,500 for distribution facilities to market the growing power output under a new arrangement for joint marketing of Bonneville and Grand Coulee power. Expenditures on the Grand Coulee project were to be held down to \$8,000,000 to complete the dam and provide installation of initial power units. For the time being, projected work on the gigantic pumping plant and irrigation works was to be shelved.

The amounts saved on the Coulee project were to be employed in expanding power facilities elsewhere. Parker dam on the Colorado river was to receive \$6,000,000, the Central Valleys project in California was to get \$25,000,000 and the Colorado-Big Thompson project was to have \$2,900,000. Minor expenditures were likewise to be employed in completing the Fort Peck project for power production and transmission facilities.

With the sale by Alabama Power company of its northern Alabama properties to TVA and co-operating public agencies for \$4,600,000, the TVA brought to a successful issue its plans for acquisition of an integrated power market. The financial effect of these acquisitions upon TVA power operations appeared from the agency's report for the fiscal year ending June 30, 1940. Covering wholesale operations only, it reported gross sales of \$15,285,000 and a net return after expenses, depreciation and tax equivalent to \$5,855,000. This represented an earning rate of 3.6% upon the investment in power properties of \$160,718,000, including a 40% allocation to power of jointly used facilities. Of the total electric output of 144,600,000 kw.hr., nearly 1,700,000,000 were sold through 75 municipalities and 35 co-operatives to more than 400,000 retail customers.

St. Lawrence River Project.—The prosecution of the war appeared to have removed some of the objections entertained by certain authorities in Canada to further activity on the St. Lawrence seaway and power project. Upon the initiative of the president, the sum of \$1,000,000 was allotted to the Federal Power commission and the army corps of engineers from the special defence fund for preliminary borings and studies on the International Rapids section of this joint navigation and power project. A special commission was appointed to supervise this work and to prepare in collaboration with a similar body from Canada a new plan for this project which should embrace not only power development and navigation works in the international section, but also works to preserve the scenic beauty of Niagara Falls and the levels of the Great Lakes. It was certain that these revised plans would envisage expenditures considerably in excess of the \$250,000,000 contemplated by the original project which the senate rejected in 1932.

Hetch-Hetchy.—A final item involving federal projects grew out of a decision by the federal courts which held that the city of San Francisco's contract with the Pacific Gas and Electric company for the distribution of Hetch-Hetchy power was not an agency contract but a sale of power for resale in violation of the Raker act. In order to dispose of this by-product power in a manner which would satisfy the provisions of this act, a new contract was being negotiated with the approval of the secretary of the interior whereby the city will lease the distribution system within the city and operate it as a public agency, with the company supplying additional power requirements and acting as a standby source of supply.

Other activities looking towards the expansion of public ownership were taking place in Oklahoma where the Grand River Dam authority had begun the production of power; in South Carolina where the Santee-Cooper project was being speeded up for national defence purposes and negotiations were on foot for the public purchase of the disjointed power properties of the Associated Gas and Electric system; in Nebraska where a consumers' public utility district completed the purchase of certain private utility systems and was negotiating for additional power markets in which to dispose of power from federal products.

Private utility systems were not idle and they were taking full advantage of the favourable money market in refunding capital issues and floating new ones at money rates which were setting new records in the cheapness of capital supply. Rate reductions were continuing in response to commission and consumer pressures, but it was noteworthy that the number of such reductions slowed up as compared with the rate concessions of 1939. The lower rate levels in the case of electric supply produced a national average consumption in residential service of 952 kw.hr. per annum, the highest in the history of the industry. (See also ELECTRICAL INDUSTRIES; LEGISLATION; TENNESSEE VALLEY AUTHORITY.)

(M. G. G.)

Publishers' Prizes: see LITERARY PRIZES.

Publishing. The number of book titles issued in the United States during 1940—11,328—was the largest since 1920, according to records of the *Publishers' Weekly*. The year's output was also possibly the largest in the history of U.S. publishing, although comparable figures prior to 1920 are not available. Macmillan again led the roster of U.S. publishers with 469 titles, followed by Grosset & Dunlap (370), Harper (271), Doubleday, Doran (210) and Oxford (181).

During the year, 263 publishing houses issued five or more books apiece. Table I gives a breakdown of all 1940 books according to classification of subject.

Best Sellers.—Any list of best sellers is subject to such qualifications as book-club sales, publication late in the year, and discrepancies between wholesale and retail sales. According to the percentage analysis of the *Publishers' Weekly*, Richard Llewellyn's *How Green Was My Valley* was the best-selling novel of 1940 with 176,280 copies sold, none by book clubs. Christopher Morley's *Kitty Foyle*, published in 1939, was second on the fiction list, and *Mrs. Miniver*, by Jan Struther, was third with 242,000 copies, including 150,000 book-club sales. Ernest Hemingway's *For Whom the Bell Tolls*, not published until Oct. 21, 1940, was fourth with 440,000 copies printed, including book-club

copies. Next were *The Nazarene*, by Sholem Asch (1939); *Stars on the Sea*, by F. van Wyck Mason, and *Oliver Wiswell*, by Kenneth Roberts. More than 300,000 copies of Roberts's novel, published Nov. 22, 1940, had been printed by the end of the year without benefit of book clubs. *I Married Adventure*, by Osa Johnson, was first on the non-fiction list with more than 200,000 copies sold, including sales of book clubs. Mortimer Adler's *How to Read a Book* followed with 72,000 copies sold. Third was *A Smattering of Ignorance*, by Oscar Levant; fourth, *Country Squire in the White House*, by John T. Flynn; fifth, *Land Below the Wind*, by Agnes Keith (1939); sixth, *American White Paper*, by Joseph W. Alsop, Jr. and Robert Kintner; seventh, *New England: Indian Summer*, by Van Wyck Brooks.

Book Fairs.—The leading fair in 1940, as in 1939, was that of Boston, sponsored by the *Boston Herald* and attended by approximately 50,000. Other fairs were held at Minneapolis, Minn., Hartford, Conn., Richmond, Va., New Haven, Conn., Rochester, N.Y., Northampton, Mass., Brattleboro, Vt., Manchester, N.H., and other cities. The New York city book fair was not held in 1940.

Great Britain.—The British book trade withstood the economic ravages of war in a remarkable manner during 1940. The decrease of 28% in new books and new editions was small enough under the circumstances. Table II, compiled by the *Publishers' Circular and Booksellers' Record* of London, provides some arresting statistics on reading habits in wartime.

The night of Dec. 29, 1940 was a sad one for the British trade. The great German incendiary raid of that night destroyed Stationers' hall, the historic centre of London publishing, and left

Paternoster row a smoking mass of rubble. Approximately 4,000,000 volumes were burned in Stationers' hall alone. (J. V. Do.)

Puerto Rico, a United States insular dependency in the West Indies; languages, English and Spanish; capital, San Juan; acting governor, Hon. C. Gallardo. The land area, including adjacent and dependent islands, is 3,400.6 sq.mi.

The 1940 census gave the population as 1,869,255, with 30.3% urban, 69.7% rural. Whites aggregated 76.2%, Negroes 23.8% (1930: 74.3% white; 25.7% Negro). Nine cities had populations

over 10,000: San Juan, 169,247 (a 47.5% increase); Ponce, 65,182; Mayagüez, 50,376; Caguas, 24,377; Arecibo, 22,134; Río Piedras, 19,935; Guayama, 16,913; Bayamón, 14,596; Aguadilla 13,468.

The density of the population is 544.2 per square mile.

History.—Puerto Rico is governed by a governor appointed by the president of the United States, and an elected bicameral legislature, and is represented in the United States congress by an elected resident commissioner. In Nov. 1940 Rear-Admiral William D. Leahy, governor since Sept. 1939, resigned, and Hon. C. Gallardo, executive secretary of the government, became acting governor pending appointment of a new executive.

In April 1940 the question of the future political status of the island came to the fore when the United States congress was asked to admit Puerto Rico to statehood. Within Puerto Rico three political parties merged as the Unification party in order to further the movement for a referendum on statehood. The radical Nationalist party, however, remained intransigently aloof and continued its agitation for complete independence. Its membership was held responsible for the attempted assassination of

CONSTRUCTION of a new \$3,000,000 dry dock for the U.S. navy near San Juan, Puerto Rico, progressed rapidly in 1940

the speaker of the insular house of representatives in September the third political assassination attempted in three years.

Meanwhile the United States quickened the tempo of its defence preparations in Puerto Rico. Despite vigorous opposition by the Nationalists, registration for compulsory military service was carried out in due course. Realization of Puerto Rico's strategic importance in defence of the Caribbean area and the Panama canal brought extended development of facilities to take care of defence needs. Construction of Isla Grande naval air base in San Juan harbour was begun, and Borinquén army air field, 75 mi. distant, was enlarged. Two other army air bases near Ponce and near San Juan were likewise being constructed. Development of port facilities and other defence measures were speeded. From less than 1,000 men on July 1, 1939, the number of United States troops in Puerto Rico was expected to exceed 20,000 by Jan. 1941.

The question of wage and hour standards in the needlecraft industry continued to be a sore problem, as employers threatened to close down rather than accede to the provisions of the United States Wages and Hours act. Temporary compromise settlements served only to postpone a final decision until 1941.

The economic situation in Puerto Rico improved markedly in 1940, largely because of defence pay rolls. Bank deposits increased by 33%, while government revenues for the fiscal year ending June 30 reached \$16,867,932, an excess of \$4,567,932, or 26.8%, over original estimates. Temporary suspension of the sugar quota system in late 1939 not only increased sales, but also removed a 170,000-ton surplus. Exports of rum to the United States likewise increased.

Education.—In 1940 Puerto Rico had 1,773 public day schools with 286,098 enrolment. The University of Puerto Rico (enrolment 5,869, 1st semester 1940-41), already an important cultural link between the Americas, was in process of development as a major centre of inter-American cultural exchange. The budget for 1939-40 allotted \$5,470,516.66 for education.

Trade and Communication.—Puerto Rico has daily air transport communication with the United States and southward to Panama. Frequent, regular steamship sailings connect the island with other parts of the West Indies and with the United States. There are 387 mi. of railway and a main highway system of 1,487 mi., supplemented by local roads. The insular government owns and operates 1,900 km. of telegraph and 3,157 km. of telephone lines (17,417 telephones).

Exports in the fiscal year 1939-40 totalled \$92,347,242, of which 98.4% went to the United States. Imports aggregated \$107,030,482, of which 94% was of United States origin. The chief exports were: sugar and molasses (62.82%); needlework (16.9%); manufactured and unmanufactured tobacco (6.6%); rum (6.03%); preserved and fresh fruits (1.6%). The principal imports from the United States were edible products (25.9%); textile fibres and manufactures (17.57%); machinery and vehicles (9.38%); metals and other manufactures (8%); chemicals (7.57%).

Agriculture and Manufactures.—Puerto Rico is primarily agricultural, with a total of 55,217 farms (1940). Agriculture provides employment for 180,000 persons. In 1939-40 production included 1,018,803 tons of sugar; 18,369,849 lb. of tobacco; 23,108,000 lb. of coffee (almost entirely for intra-island consumption); 325,000 boxes of grapefruit; 630,000 crates of pineapple; and 12,898 cwt. of cotton.

Manufacturing is limited, with only the needlework, rum and tobacco industries supplying extensive manufactured goods for export. Rum exports, supplying two-thirds of United States demand, totalled \$5,568,476 in value in 1939-40. Manufacturing and mechanical industries employed 96,148 persons in 1940.

Finance.—The monetary unit is the United States dollar.

Purdue University, at Lafayette, Ind., is Indiana's Land Grant institution, created under the Morrill Act of Congress of 1862, granting to each state public lands for the establishment of a university for the teaching of agriculture, science, and the mechanic arts." Enrolment as of Oct. 1, 1940, was 6,967, divided as follows: all engineering, 1,487; agriculture, 842; pharmacy, 181; science, 918; home economics, 898; physical education, 137; graduate students, 456. For some years Purdue has had the largest engineering enrolment of any institution of higher learning in America. The faculty and staff number more than 900.

Research work on the campus was being expanded in the fields of agriculture, engineering, science and pharmacy. New investiga-

tions of importance were in progress in the field of physics with the cyclotron or "atom smasher"; commercial exploitation of the important research on the nitration and chlorination of hydrocarbons was of great value to industry and employment. Basic research was continued in many fields with private and governmental agencies, particularly in the defence program of the nation. The university continued its flight training under the Civil Aeronautics authority.

The Hall of Music with 6,208 seats was dedicated May 3 and 4, 1940, and the Memorial Union building, one of the most complete in America, was greatly enlarged through completion of three additions. Construction also was under way on additions to the airport hangar, electrical engineering and agricultural engineering buildings, and a new physics building was started. Buildings on the campus and adjoining farms in 1940 numbered 74.

During the year a total of 42,936 persons attended the 86 conferences of short courses held on the campus, representing a far-flung service to the state.

Pusey, William Allen (1865-1940), U.S. dermatologist, was born in Elizabethtown, Ky., Dec. 1, and was graduated from Vanderbilt university in 1885 and from the medical college of New York university in 1888. He engaged in practice the next year and in 1894 was made professor of dermatology in the college of physicians and surgeons of the University of Illinois, holding the post until he was retired as professor emeritus in 1915. He was president of the American Medical association in 1924-25 and of the American Dermatological association in 1910. He died in Chicago, Aug. 29.

Pyrite or Pyrites. World production of pyrite in 1938 reached 10,000,000 metric tons but declined slightly in 1939. Spain is normally the leading producer, but the industry suffered heavy declines during the Spanish civil war and was temporarily surpassed by Japan. In the next rank of producers with outputs of 500,000-1,000,000 tons, are Norway, Italy, the soviet union and the United States; in the 100,000-500,000 ton group are Cyprus, Germany, Portugal, France, Greece, Canada and Sweden, and a number of others have still smaller outputs. With no data available from Spain, Japan and the soviet union, no estimate can be given on 1940 world output.

The United States output of 516,400 long tons in 1939, a 7% decrease from 1938, was insufficient to meet the demand, and was supplemented by imports of 482,300 tons, almost entirely from Spain. Imports for the first ten months of 1940 fell to 285,500 tons.

British production of pyrite is insignificant (4,300 long tons in 1938); Australia, Southern Rhodesia and South Africa have outputs of 20,000-30,000 tons; there is no direct production in Canada, but by-product concentrates were recovered from copper ores and sulphur and sulphuric acid were produced from smelter gases, containing a total of 210,700 short tons of sulphur content in 1939, equivalent to about 421,000 tons of pyrite. (G. A. Ro.)

Quakers: see FRIENDS, RELIGIOUS SOCIETY OF.

Quebec, one of the original provinces of the Dominion of Canada; area, 594,534 sq.mi.; population, according to the Dominion census of 1931, 2,874,255; estimated Jan. 1, 1941, 3,210,000. Capital, Quebec, 130,954. The only city with larger population is Montreal, 818,577. Of the province's population 1,813,606 are urban, or 63%; 2,696,122 native born; only 178,133 foreign born.

Two types of trade unions are found in Quebec; the national Catholic unions and the older international unions. The former

have a membership of about 71,833, while the membership of the latter is 43,656. The net value of production in the province for 1937 was \$759,264,651, an increase of 15% over the preceding year. The gross value of agricultural products in 1937 was \$110,218,770, of manufactures \$445,885,666, an increase of nearly 6% over the preceding year.

The Union Nationale administration of the Hon. Maurice Duplessis was defeated in Oct. 1939 and the Liberals were returned to power with the Hon. A. Godbout as premier and attorney-general. The standing of the different parties (1940) was as follows: Liberal, 68; Union Nationale, 16; Independent, 1; and National 1. Sir Eugène Fiset was the lieutenant governor. Quebec is represented in the dominion parliament by 24 senators who are appointed for life and by 65 members of the house of commons who are elected for five years or less.

BIBLIOGRAPHY.—*Statistical Year Book; Annual Report of the Provincial Secretary and Treasurer.* (J. C. HE.)

Queensland. A state of the Australian commonwealth lying in the northeast and occupying 670,500 sq.mi.; pop. (est. Dec. 31, 1939) 1,015,927. Chief towns (pop. Dec. 31, 1939): Brisbane 326,000; Rockhampton 32,600; Townsville 31,450. Governor: Sir Leslie Orme Wilson, G.C.S.I., G.C.M.G., G.C.I.E., D.S.O.

History.—Forgan Smith who had been premier since 1932 continued in office throughout the year 1940. Two new acting ministers, J. O'Keefe (Cairns) and M. E. J. Walsh (Mirani), were elected to the Queensland ministry by the labour caucus in May.

The secondary industries of the state benefited by defence contracts, and full employment was being experienced in most industrial and manufacturing undertakings. The prosperity of the state was enhanced by improved wool receipts, the satisfactory outlook in the sugar industry and the favourable position of the dairying industry.

Direct overseas exports were 10% higher in 1939-40 than during the previous record year.

The production of sugar is worth more to Queensland than any other single industry. The production for 1939-40 at 891,000 tons created a new record, and the sugar cheque amounted to £14,000,000. The outlook for the 1940-41 crop was satisfactory, but owing to damage by cyclones in some areas, production was estimated to be about 80,000 tons less than for the previous season.

The percentage of unemployment at June 30, 1940 was 5.1%. It is computed that, even at a time of unlimited demand for labour, this unemployment percentage cannot fall below 3.5 because of the unavoidable intermittency of work in many of the important Queensland industries.

Work was commenced on the Inland Defence Road on which £200,000 was to be spent during the financial year.

Justice Macrossan succeeded Sir James Blair as chief justice of the supreme court, but died on June 21, five weeks after his appointment. He was succeeded by the senior puisne judge, Justice Webb.

Education.—In 1938: schools 1,951; scholars 194,246.

Banking and Finance.—Revenue (1939-40) £A20,756,000; (est. 1940-41) £A21,199,000; expenditure (1939-40) £A20,740,000; (est. 1940-41) £A21,193,000.

Communication.—In 1939: roads, motor 39,000 mi.; railways 6,567 mi. Motor vehicles licensed (June 30, 1939): 76,842 cars and taxis; 43,153 commercial; 8,168 cycles. Wireless receiving set licences 133,217. Telephones 82,226.

Agriculture, Manufactures, Mineral Production.—Production in 1938-39: sugar, cane 823,086 tons; wheat 8,583,736 bu.; maize 3,733,424 bu.; wool 185,000,000 lb.; gold (1939) 145,667

fine oz.; silver (1939) 3,600,000 oz.; coal 1,121,000 tons. Industry, manufacturing, 1938-39: factories 3,087; employees (average) 51,551; production, net value £A19,301,475.

(W. D. MA.)

Quicksilver: see MERCURY.

Quisling, Vidkun Abraham (1887-), Norwegian soldier who achieved notoriety in 1940 as an alleged traitor to his country during the Nazi invasion and thus contributed his surname as a synonym in the English language for the word "betrayal." He was born July 18 at Fyresdal, Norway and was trained from his youth for a military career. After passing the Norwegian war college examination in 1911 he entered the army, received his commission as captain, and was promoted to major of field artillery in 1931. Concurrently he had pursued a diplomatic career, as military attaché at Leningrad (1918-19) and Helsingfors (1919-21). He was a close friend of the explorer, Fridtjof Nansen, with whom he was associated for a time. In May 1933, four months after Hitler became chancellor of Germany, Quisling formed the Fascist National party of Norway. Quisling assisted the Nazi invasion of Norway on April 9 by using his authority as army officer to delay mobilization, surrender certain key positions, and urging his countrymen not to resist the German troops. On Sept. 25, 1940 Quisling was proclaimed by the German forces as the fuhrer of Norway whose task it was to "reconstruct" his country in conformance with Nazi principles.

Radio, Industrial Aspects of. The following developments of 1940 were significant in the United States:

1. There was another marked rise in radio revenue accompanied by a rise in profits (though at a slower rate).
2. Operating expenses jumped appreciably. Consequently, the industry undertook an out-and-out battle with the American Society of Composers, Authors and Publishers after the latter had demanded higher licence fees.
3. Frequency modulation and television claimed much attention financially (and from the government), although television's exact status was still somewhat nebulous in 1940.
4. The industry exhibited a renewed alertness to the desire of the public, the demands of national defence and co-operation among the North American neighbour nations.

Radio v. Government.—The "Network Monopoly" Investigation.—There is a clause in the Communications act of 1934 to the effect that the Federal Communications commission may make "special regulations applicable to radio stations engaged in chain broadcasting." This latent power has never been invoked. But in 1937 a rising sentiment in congress prompted the FCC to order a general investigation of the networks. In the ensuing hearings, the National Broadcasting company and the Columbia Broadcasting system pleaded that they had refrained from monopolistic conduct and that their contracts, etc., were equitable. But the Mutual Broadcasting system (younger than its colleagues) charged that NBC and CBS had acquired such an iron grip on affiliated stations that Mutual was sometimes hampered from rendering proper service.

On June 12, 1940, a year after the last of the probings, the FCC made public its report on the networks. With unprecedented severity, the government agency belaboured the chains on the following grounds:

- a. For retaining two and one-half times as much money as they paid to independently controlled stations on their hookups.
- b. For optioning from two and one-half to three times as much time from their affiliates as was necessary.
- c. For barring stations from accepting the services of more than one major network.
- d. For demanding that affiliated stations maintain a national rate which will not undersell the network rate.

The FCC accused the networks—specifically NBC and CBS—of laying their ownership open to unauthorized change via stock market transactions; of controlling large sectors of the talent business; of limiting service to profitable communities, and excluding the less profitable ones; of making inroads on the electrical transcription business, sometimes by implied unfair means; and of issuing contracts binding for longer periods than the actual licence term of a station. The report concluded:

"The heart of the abuses of chain broadcasting is the network-outlet contract. It is the committee's considered opinion that many of the existing inequities and arbitrary practices will find correction in the reformation of these contracts."

In answer to these charges, NBC and CBS made a flat denial, indicating that the "monopoly report" contained vital errors of fact as well as interpretation. The exclusive network contract, according to NBC and CBS, is the sole system of operation which guarantees adequate service to both public and advertisers. The Mutual Broadcasting system again dissented, and asked the FCC to issue regulations limiting a network's hold on its affiliates.

In order to clarify the situation, the FCC thereupon proposed seven rules and asked the networks to state their arguments against them. Such rules would:

- (1) Limit or abolish exclusive network contracts; (2) decrease option time; (3) limit the length of contracts between networks and affiliates; (4) abolish the network's privilege of asking stations to maintain certain rates; (5) limit each network to one affiliated station per city; (6) limit network ownership of stations; and (7) guarantee stations the right to reject network programs "for reasonable cause."

No final decision on the whole affair was reached, but action of some kind was anticipated for 1941. The "monopoly report" and its resultant uproar stirred the interest of congress to greater heights, and there was talk of special legislation directly from this body.

Television and Frequency Modulation.—The progress of these new arts is discussed elsewhere in this volume (*see* RADIO, SCIENTIFIC DEVELOPMENTS OF; TELEVISION). The Federal Communications commission in 1939 recommended that television be given the "green light," meaning that partial commercialization was to be permitted. A few days after the final commission order was made public in Feb. 1940, the Radio Corporation of America announced a threefold television program to publicize the new art heavily. This program fell into disfavour with the FCC which immediately rescinded its permission for television commercialization, and said:

"The possibility of one manufacturer gaining an unfair advantage over competitors may cause them to abandon the further research and experimentation which is in the public interest and may result in crowding them into the market with apparatus at present efficiency levels."

In a series of new television rules promulgated since that time, the FCC stipulated that no one person may own or control more than three television stations, nor may any two of these be in the same service area.

With respect to frequency modulation, the commission placed similar restrictions on ownership. No person may own or control more than six stations, and here again; no two may be located in the same service area.

Changes in FCC Personnel.—On Oct. 14, Thad H. Brown, who had been a member of the Federal Communications commission (and its predecessor, the Federal Radio commission) since 1932 withdrew his name as a re-appointee. President Roosevelt had designated him for a new term of seven years, but in the midst of senate hearings on the matter he asked that his name be withdrawn. His withdrawal left the FCC in 1940 with only a six-man board, no one having been named to fill the vacant place.

Programming.—*Network Commercial Programs.*—About half of radio's gross revenue is derived from network commercial programs. The 15 most popular network commercial programs as of Dec. 1¹ were:

1940	1939
1. Jack Benny	1. Chase & Sanborn Program (Edgar Bergen, etc.)
2. Chase & Sanborn Program (Edgar Bergen, etc.)	2. Jack Benny
3. Fibber McGee & Molly	3. Lux Radio Theatre
4. Lux Radio Theatre	4. Kraft Music Hall (Bing Crosby)
5. Bob Hope	5. Fibber McGee & Molly
6. Kate Smith Hour	6. Major Bowes
7. Major Bowes	7. Bob Hope
8. Kay Kyser	8. Kate Smith Hour
9. Aldrich Family	9. Fitch Bandwagon
10. One Man's Family	10. Kay Kyser
11. Fitch Bandwagon (guest orchestras)	11. Good News (Edward Arnold, Fanny Brice)
12. Fred Allen	12. One Man's Family
13. Walter Winchell	13. Fred Allen
14. Kraft Music Hall (Bing Crosby)	14. Burns & Allen
15. Eddie Cantor	15. Pot o' Gold

Since 1939 the tendency toward shorter, less formal programs has continued. Whereas in 1939 eight 60-minute programs qualified for the leading 15, in 1940 the number decreased to five. Drama continued to be represented even more strongly. And a war-inspired appetite for news and comment boosted Walter Winchell into 13th ranking position, whereas in 1939 no commentator or newscaster qualified at all.² Major Bowes and Kay Kyser (in seventh and eighth positions respectively) once more underscored the fact that the audience-participation type of program is still very popular.

Network Evening Programs.—In order that the network evening picture (commercials only) may be clear, programs are compared by categories. This tabulation covers June-December for both 1940 and 1939³:

Type of program	1940 Pct. of Total	1939 Pct. of Total
1. Variety	24%	36%
2. Drama	19%	18%
3. Tests, contests, quizzes, etc.*	18%	16%
4. Popular music	13%	8%
5. News and news comment	10%	6%
6. Familiar music	7%	3%
7. Classical music	3%	3%
8. Comedy teams (Amos 'n' Andy, etc.)	2%	3%
9. Religion	1%	1%
10. Semi-classical music	1%	3%
11. Sports	1%	1%
12. Talks, gossip, instruction	1%	1%

*Also referred to as "audience-participation" programs.

The decline in variety programs in 1940—the big, expensive offerings composed of music, drama, novelty, etc.—was striking. Most of these programs are founded on "name star" values, principally headliners of the Jack Benny, Fred Allen, Bob Hope calibre. They are thus extremely costly, and are furthermore limited somewhat by the available supply of "star" talent. In view of such factors, advertisers in 1940 did not consider variety programs "outstanding buys," and therefore started a trend toward cheaper, less formal shows. Furthermore, in radio entertainment—as in all other forms of entertainment—conspicuous success immediately invites competition. Hence successful programs of the quiz type, which are usually cheap and draw a good audience, have pried the variety programs loose from their erstwhile stronghold. This is not to say that in future years the variety show will be outmoded. Headliners will always be in demand among those advertisers who have large appropriations for programming. But otherwise variety was in 1940 commanding much less attention than formerly.

¹ These ratings are supplied through the courtesy of A. W. Lehman, manager of the Cooperative Analysis of Broadcasting, and are copyrighted by the latter. The CAB is the industry's major fact-finding body in the field of programming.

² Lowell Thomas ranked among the first 15 programs at various times during 1940.

³ Compiled especially for the *Britannica Book of the Year* by the *Variety Radio Directory*. This system of calculation automatically weights the bigger programs for their increased availability to listeners.

Drama meantime forged ahead. Radio's technical capacity has vastly increased during the past several years, as has the supply of good writers, and this combination of circumstances is to drama's advantage. Drama has the additional quality of varying widely in content, enabling an appeal among all levels of the listening audience, and usually at a cost which is not excessive. Drama therefore should continue to command more and more attention in the future.

Quiz, contest and audience-participation programs in 1940 remained at a high level. Thirty-three such programs appeared on the major networks in 1940. An analysis of their appeal must take into consideration:

(1) That games have always been popular in the American home; (2) that self-education is deemed important by some sectors of the audience; and (3) that the near-lottery appeal of a number of the programs is a further inducement to listen.

The position of news and news commentators is self-evident in view of the war and the presidential campaign. As a concrete example of the widespread interest in news, the Cooperative Analysis of Broadcasting reported that "between Aug. 24-29, 1939, news broadcasts covering the war crisis accounted for 18.7% of all daytime program mentions, and 27.2% of all evening program mentions. . . ."

Network Daytime Programs.—Again in 1940, serial dramas (akin to the comic strips in newspapers) and dramatic offerings of other types continued to occupy the vast majority of network commercial time. The apparent 7% decrease noted in the table below is really a mathematical quirk resulting from the interjection of "opera" as a new commercial category this year. Over 70 different dramatic series appeared on the networks in 1940. The following tabulation is the daytime equivalent to the evening table cited above:

Type of program	1940 Pct. of Total	1939 Pct. of Total
1. Serials and drama	78%	85%
2. Opera	9%	...
3. Talks and instruction	6%	5%
4. News and news comment	1%	4%
5. Variety	1%	2%
6. Religion	1%	1%
7. Single acts (one-person variety entertainment)	1%	1%
8. Semi-classical music	1%	...
9. Hymns	LT	1%
10. Audience participation, tests, etc.	LT	LT
11. Familiar music	LT	LT
12. Popular music	LT	2%
13. Novelty	LT	LT

(LT signifies less than one-half of 1%.)

Talent Costs.—Based on data compiled by *Variety*, the aggregate talent costs of network commercial programs during 1940 amounted to \$35,000,000, of which \$30,000,000 was consumed on evening programs and \$5,000,000 on daytime programs.

Increased Listening.—Listeners devoted more attention to radio in 1940 than ever before. Cooperative Analysis of Broadcasting reports indicate that during the first portion of the year, listening to network evening commercial programs was 37% higher than in 1939. During the summer, evening listening stood 25% above the prior year, while daytime listening had advanced 11%. It seems apparent that radio's barrage of war and presidential news played a conspicuous role in the acquisition of more listener-attention.

Educational and Public-Information Programs.—There was in 1940 a decided improvement in the quality of programs falling into this category. The industry's whole-hearted co-operation with the government in the national defence program was an outstanding example of public service. At no time has radio spared expenses in advancing public education or information. CBS, for instance, reputedly allotted \$30,000 per month toward war coverage in the summer of 1940. And the U.S. office of education esti-

mated that since 1936, U.S. stations donated nearly \$1,000,000 annually in free time for education purposes.

Local Station Programming.—Non-network programming showed very few changes. Bigger stations attempted to schedule a balanced, "all around" radio diet, while the smaller outlets found their greatest programming sources in music, news and sports.

Quiz and Contest Programs.—On March 29 the Federal Communications commission announced that in its estimation five contest programs violated that section of the Communications act which prohibits lotteries. The FCC therefore referred the matter to the department of justice for a ruling. Here the crusade came to naught, however, for the attorney-general's office held that "prosecution . . . should not be instituted." The five programs were of the cash "give-away" type, awarding listeners monetary considerations either on the basis of skill in some game, or by outright chance. All of them successfully escaped the legal definition of lottery. Craig Earl (known on the radio as "Professor Quiz") estimated that between 400 and 500 U.S. stations were carrying programs of the quiz kind.

New Name Stars.—Practically all the great and near-great "names" of the world have at some time or another appeared on the radio. Two exceptions were the Lunts and Katharine Cornell. In 1940 both made their debuts under the auspices of the Red Cross.

Radio Set Ownership.—U.S. set ownership, as of Jan. 1, 1941, as compiled by Orestes Caldwell, editor of *Radio Today*, is as follows:

Total sets in use	50,197,000
Auto radios	8,000,000
Battery portables	1,800,000

Revenue and Finance.—**Revenue 1940.**—Preliminary revenue estimates for 1940 (which will not be verified until the summer of 1941 when the FCC computes official figures) assign the following intake to broadcasting:

	1940	1939
Network gross time sales	\$96,000,000	\$ 83,114,000
Total industry gross time sales	190,000,000(?)	167-170,000,000
Total industry net time sales	145,000,000(?)	129,470,000

"Gross" time sales represent the sale of time prior to any discounts whatsoever. The figure is computed solely for purposes of comparing radio intake with the intake of other advertising media. "Net" time sales are actual cash receipts.

The networks—which once more enjoyed a huge rise in revenue—found their best customers among the manufacturers of "quick turnover" items, principally the makers of grocery and drug lines, including foods, soaps, beverages, toilet goods, cigar products and confectionery products. Some 85% of all network revenue comes from these two major categories. Network radio has proved to be peculiarly effective in the advertising of such "quick turnover" lines for two main reasons: (1) network radio is a relatively cheap means of reaching a big audience; and (2) radio has the inherent ability to spread advertising stimuli at the right time, and as frequently as the advertiser desires.

Profit.—During 1939 (1940 figures were [Jan. 1, 1941] not available), a total of 478 broadcasting stations, representing 68% of the 705 operators, showed an excess of revenue over expenses. On the other hand, 227 stations, or 32%, showed a combined loss of \$2,220,471. Addition of profit and loss indicates that all U.S. stations exceeded their expenses by \$18,206,716 prior to federal taxes. The networks during this interval had a profit of \$5,631,228, making the industry total \$23,837,944. This showing was about \$5,000,000 better than in 1938.

Expenses, on the other hand, skyrocketed by \$7,500,000 to

Above: A "BEER MUG" radio relay station was used to broadcast floor proceedings of the two U.S. national political conventions in 1940

Above: INTRODUCTION OF FREQUENCY MODULATION broadcasting was an important radio milestone of 1940. On Aug. 1 Maj. Edwin H. Armstrong, inventor of "FM," flipped the key that launched W2XOR in New York city as the first full-time station for broadcasting static-free programs

Below: MAX JORDAN, U.S. radio war correspondent, broadcast an eyewitness account of the war in the spring of 1940 from a vantage point 500 metres from the German border

Below: MONITORING short-wave broadcasts from Europe in 1940

reach the unprecedented total of \$100,043,920. In other words, the rise in the rate of profit slowed down, whereas the rate of expense increased.

Table I shows one further breakdown of 1939 revenue and serves to indicate still more clearly the incidence of expenses and profits by individual broadcast stations.

Table I.—Expenses and Profits in 705 U.S. Radio Stations in 1939

Revenue Group	No. of Stations	Total Expenses	Total Profits
\$1,000,000 or over	6	\$ 6,970,636	\$ 3,489,487
500,000 to \$1,000,000	32	15,587,973	6,811,274
250,000 to 500,000	63	15,584,085	5,090,028
225,000 to 250,000	14	2,382,903	839,923
200,000 to 225,000	8	1,293,310	372,504
175,000 to 200,000	16	2,381,697	500,685
150,000 to 175,000	15	2,168,011	175,606
125,000 to 150,000	27	3,101,968	506,450
100,000 to 125,000	35	3,501,508	211,548
75,000 to 100,000	59	4,736,528	214,956
50,000 to 75,000	87	5,107,012	277,757
25,000 to 50,000	157	6,058,864	98,474*
15,000 to 25,000	83	1,823,206	70,654*
1 to 15,000	103	1,086,529	105,266*
	705	\$71,783,930	\$18,206,716

*Indicates deficit or other reverse items.

Industry Assets.—The tangible property of the entire industry in 1939 had a depreciated value of \$35,545,645. The original cost was \$64,424,626.

Radio v. Other Advertising Media.—Again in 1940, radio's rate of advertising growth appeared to have exceeded that of the other major media. During 1939 radio's gross advertising revenue increased 12½% over 1938, whereas magazine revenue increased 2½% and newspaper revenue 1½%. The year 1939 also marked the first time that radio's total advertising revenue appreciably exceeded magazine revenue.

Employment-Unionism.—**Employment.**—Radio's boast that it pays higher wages than any other U.S. industry was again maintained in 1940. Employment figures applicable to the early part of the year are shown in Table II.

Table II.—Employment Figures of the U.S. Radio Industry

	1940	1939
Full-time employees	19,873	18,359
Average weekly compensation	\$45.94	\$45.20
Part-time employees	4,014	4,377
Average weekly compensation	\$22.66	\$23.55

(These figures were compiled by the Federal Communications Commission. They include all standard broadcast stations and the three major networks.)

There is, of course, quite a divergence in pay scales between the major networks and the individual stations. On the whole, however, the scales were high in both instances in 1940, as will be seen via the tabulation in Table III.

Table III.—Average Pay Scales in the Radio Industry in the U.S.

Employment Category	Average Wkly. Station Pay	Average Wkly. Network Pay
General managerial executives	\$110	\$382
Research-development employees	54	66
Operating (technical) employees	39	66
Program production employees	39	56
Writers	32	57
Announcers	33	66
Staff musicians	48	126
Commercial salesmen	48	121

The average pay for all executives on all individual stations was \$80 weekly; on the networks it was \$230. The average pay for all types of employees (other than executive) on individual stations was \$37; on the networks it was \$58.

Unions.—Organized labour by 1940 was an accepted fact in the radio industry. Unions gained their foothold almost entirely by means of negotiation. Strikes were so few as to be statistical oddities.

At the beginning of 1940 it was feared that there would be a major ruction between the broadcasters and the American Federation of Musicians (an A.F. of L. affiliate). The musicians' contract was due for renewal, and the union indicated that it wanted an annual guarantee at least \$1,500,000 higher than the previous \$3,000,000 guarantee. Networks and stations alike balked at this 50% increase. A strike seemed imminent when Assistant Attorney General Thurman Arnold¹ issued a statement denouncing "restraints designed to compel the hiring of useless and unnecessary labour." Following this dictum, the musicians dropped their formal proposals, and the broadcasters advanced no counter-proposals. Subsequently both factions proceeded as if the old contract were in force, although that paper expired.

Meantime, the actors-singers-announcers' union (American Federation of Radio Artists, also an A.F. of L. affiliate) was awarded a new network contract valid until 1943. The agreement—a dual affair—covers both sustaining and commercial programs. It provides for a pay increase of about 10% on sustaining programs, and continues the previous commercial rates without change. As in the case of the musicians' union, the broadcasters' relationship with AFRA was unmarred by strikes. When two major outbursts threatened in the course of the year, one was settled by arbitration, and the other succumbed to the pacifying influence of mediators.

Literary-Musical Property.—**Literary Property.**—It took the industry many years to acquire a technique whereby a book or play could be effectively re-created by aural means alone. And even when this point had been reached radio continued to be without a literature of its own and had to borrow freely from writings in other fields. In recent years, however, radio developed an intramural roster of serious writers and by 1940 their output exceeded by a considerable margin the borrowings from the classics. This trend is clearly illustrated in the figures shown in Table IV (covering network programs only).

Table IV.—Source of U.S. Radio Material

	1940	1939
Adaptations of stage plays	111	165
Adaptations of prose and poetry	89	60
Total adaptations	200	225
Serious materials especially written for radio	286	207

Musical Property.—There has never been a time in the history of broadcasting when the industry was not at sword's-point with the American Society of Composers, Authors and Publishers (ASCAP). The latter is a voluntary alliance of composers and music publishers for the purpose of licensing the performing rights to their pooled compositions. In the very earliest days of radio, ASCAP won an impressive series of court victories over the broadcasters, thereby establishing the right to collect licence fees from radio for the use of ASCAP music. These fees, however, were not geared to the amount of music used. Rather they took the form of a flat tax of 5% on a station's net business, a sum which in 1939 aggregated \$4,142,000.² Another feature of the ASCAP contract has been that no fee is applied directly against the networks. That portion of network business paid over to the stations is taxable, but the portion retained by the networks themselves escapes fees.

Surmising that when the current ASCAP contract expired ASCAP would ask for higher fees plus a provision covering the networks, the broadcasters in 1938 launched a music society of

¹ Cf. Thurman Arnold's letter of Nov. 20, 1939 to the Central Labor union in Indianapolis. The letter referred to building trade unions, but was interpreted as also applying to the musicians' union.

² Stations controlled by newspapers have a separate contract calling for 5% payments only on those programs using ASCAP music.

their own called Broadcast Music, Inc. (BMI). Primarily designed as a lever to pry down ASCAP demands, BMI gradually developed from a mere threat into a music reservoir of sizable proportions.

In the summer of 1940 ASCAP issued a proposed new contract designed to become effective at the beginning of 1941. True to expectations, a network fee—amounting to 7½%—was included. Station fees remained the same in some instances, and were reduced in others. But on the whole, ASCAP's expectations of revenue were set considerably higher than before.

The majority of stations and all of the networks flatly turned the new ASCAP contract down. Which—in simplest terms—meant that there would be no ASCAP music on virtually all of radio after Jan. 1.

Open warfare toward the close of 1940 was being pursued by both sides, and the department of justice was inaugurating proceedings against ASCAP, BMI, NBC and CBS under the Sherman act. It was the department's contention that the music societies have engaged in illegal price-fixing, and that they were mutually boycotting each other in an attempt to gain monopoly of the field.

Phonograph Records.—In July 1939 the industry received a legal blow when a court decision held that (1) phonograph records may not be broadcast via radio if the manufacturer intends them for use in homes only; and (2) that the recording artist has a right to stop the broadcasting of phonograph records made by him, since this constitutes unfair competition to his personal appearances.

This decision seemed to pave the way for the licensing of records—a trend which would prove quite costly to the broadcasters. But in the interim all parties to the original suit were not satisfied. They carried the case to another court, and here the broadcasters in 1940 won a sweeping victory. Said the court:

"We think the 'common law property' in these (recorded) performances ended with the sale of the records and that the restriction (warning against use via radio) did not save it; and that if it did, the records could not be clogged with a servitude. . . .

"Copyright in any form . . . consists only in the power to prevent others from reproducing the copyrighted works. WBO Broadcasting Corp. (the defendant) has never invaded any such right of Whiteman (complaining artist); they have never copied his performance at all; they have merely used copies which he and the RCA Mfg. Co. made and distributed. . . ."

Research.—Traditionally radio has always been in the forefront of research as regards markets and media. Because radio "coverage" cannot be counted like newspaper or magazine circulation, the broadcast industry has perforce had to avail itself of the tools offered by psychology and statistics.

In 1940 definite changes in radio research took place. Technically, there was a trend toward the use of smaller samples, but under circumstances of better choice and cultivation. In short, the keynote of 1940 was intensification, coupled with a tendency to pay more attention to research of the "qualitative" type.

One major topic of the year was the measurement of radio's efficacy as a sales medium. Numerous studies appeared, indicating what effect radio advertising had in influencing the purchase of this or that brand of goods.

Another type of probing consisted in measuring the psychological impact of programs and their advertising messages. The purpose of studies such as this is to determine the listener's continued—but varied—reaction to the component parts of a program, and to correct those portions not favourably received. A great aid in research of this type is the recent Lazarsfeld-Stanton program analyzer, an electrical device to record listener reaction.¹

Radio in the Western Hemisphere.—Since the beginning of the war in Europe, the U.S. has politically and economically paid

more and more attention to its neighbour nations in the western hemisphere. This attitude has likewise been reflected by the broadcasting industry which is seeking in every way possible to cement better relations on the two western continents.

North American Regional Broadcasting Agreement.—This treaty divides radio waves equitably among all the principal North American nations, and ends the wave-length chaos of former years. Mexico was the last of the nations to ratify the document (which was framed in 1937), but on March 29, 1940 the Mexican ambassador to Cuba formally deposited the ratification papers with that government. In the U.S., the treaty stipulations will take effect on March 29, 1941 when all but 95 of the 850-odd stations must shift their frequency (wave-length) to comply with the new international rules.

One of the major effects of the treaty will be the doom of the notorious Mexican border stations. Many of these were operated by U.S. capital which had been denied access to U.S. radio facilities. Operating with high wattage, the border stations not infrequently "pirated" wave-lengths otherwise assigned in the U.S., and blasted a signal across the midwest to advertise "health aids" and similar "medical" cures. It had long been rumoured that these powerful evaders were instrumental in delaying Mexico's ratification of the treaty so many years. Plans were afoot in 1940 to buy out unscrupulous U.S. interests with Mexican capital. At any rate, hopes were high that this border nuisance would be abated.

As regards the effect of the treaty within the borders of the U.S., there is much room for argument. True enough, interference from other nations is abolished. But under the treaty the U.S. is allowed a certain number of high-power stations which are to be interference-free from other U.S. stations at night. The FCC however, has shown an inclination to believe that the owners of these stations will get undue social and economic advantage over their competitors. The commission proposed a second full-time station on a channel which, under the North American agreement, specifically cannot have such a second station operating at night. How this FCC attitude will affect the execution of the treaty in years to come was not predictable in 1940.

U.S. Latin-American Broadcasts.—The National Broadcasting company not only issues a steady stream of programs to Latin and South American nations via two high-powered short-wave stations in Bound Brook, N.J., but also sells time to sponsors who wish to reach the markets to the south of the U.S. Eleven such sponsors in 1940 used the NBC facilities. NBC estimates that of the 4,000,000 Latin-American radio sets, about 2,500,000 were equipped in 1940 to pick up its short-wave signals. Fan mail from this sector has been increasing appreciably, indicating an interest in the programs.¹

During the year, network officials toured South America extensively, and on the occasion of Gen. Manuel Ávila Camacho's inauguration as president of Mexico, U.S. broadcasters "covered" the event with great fanfare. In the past, U.S. broadcasters have all too frequently been accused of sending out programs which fail to exhibit an understanding of the Latin-American taste or temperament. Corrections in such fatal errors undoubtedly will be made after a firsthand knowledge of the neighbour nations is obtained. It is also possible that in the future some arrangement will be worked out whereby U.S. broadcasters and Latin-American broadcasters will "trade" employees after the manner of "visiting professorships" in universities. This scheme would promote genuine mutual understanding and co-operation.

The Columbia Broadcasting system announced that it is forming

¹ Developed by Dr. Frank Stanton, research director of CBS and Dr. Paul Lazarsfeld, director of Columbia university's Office of Radio Research. The device has two buttons which the listener may alternately push to register "favourable" or "unfavourable" reactions to a radio program. A stylus records the reactions as a running line on graph paper.

¹ Additionally, NBC allows Latin-American stations to rebroadcast its programs without fee. This procedure enables acquisition of an audience among those set owners whose receivers cannot pick up short-wave signals.

COAXIAL TRANSMITTING ANTENNA of station WOR for frequency modulation broadcasting, begun in 1940 at New York city

a Latin-American network to begin operations in Sept. 1941. The hookup will include 39 long-wave and 25 short-wave stations in 18 of the 20 republics to the south. However, because of the difficulty of installing and maintaining telephone lines to "haul" the programs from point to point, short-wave signals will be used. Member stations on the network will pick up the short-wave impulses, and convert them into regular long-wave emissions. The network, CBS claims, is founded with goodwill principally in mind. For that reason, programs will be sent not only to the south, but received from the south for U.S. consumption. Sponsored shows will be accepted.

Canadian Radio.—In the fiscal year ending March 31, 1940, the Canadian Broadcasting corporation had a commercial revenue of \$774,000 as against \$642,000 in the prior year. Meantime the corporation received \$2,907,000 in licence fees (on receiving sets), representing an increase of about \$250,000 over 1939.

The year 1940 brought few new regulations governing the conduct of Canadian radio, the bulk of such regulations having been framed at the start of the war. One new rule, however, caused much debate prior to its passage. This regulation limits sponsorship of news broadcasts to one spot announcement prior to the newscast, and one following it. Broadcasting of radio contests was also banned on Sundays because it appears that such broadcasts would violate the Lord's Day act.

The official estimate of Canadian radio families for Jan. 1, 1940, was 1,677,000. This figure is undoubtedly a minimum, and actual radio ownership may be somewhat higher.

As regards programming, the official tabulation shown in Table V (prepared by the Canadian Broadcasting corporation to cover

Table V.—Types of Program Current in Canadian Radio

Type of program	Pct. Hrs. Oct. 1940	Pct. Hrs. Oct. 1939
Musical programs	52%	60%
News bulletins	19%	16%
Talks	13%	11%
Variety	5%	6%
Stocks, rural and farm broadcasts	7%	3%
Drama	3%	2%
Special events	1%	1%
Public service	LT	LT
Children's programs	LT	LT

(LT signifies less than one-half of 1%.)

its programs during the month of October) is illuminating. It clearly indicates that the CBC is "loosening up" its schedules—that is, there is less formality and more "current interest" and "human interest" material. This trend cannot be underestimated,

for it indicates the increasing value and maturity of Canadian radio.

(E. A. Gd.)

Great Britain.—Throughout 1940, the British Broadcasting corporation carried on an uninterrupted broadcast service. Outstanding developments were the introduction of a program for the forces and a large-scale expansion of the overseas services.

At July 31, 1940, there were 9,132,200 wireless licences current in the United Kingdom. A "listening barometer" based on daily enquiry among representative samples of listeners and showing daily the audience for each item now enables the BBC to gauge the amount and nature of listening to BBC programs. During the year record audiences listened to the broadcasts by the king and the prime minister.

During 1940 the BBC's primary aim was to further the country's war effort. News was given, to listeners at home and all over the world, with the utmost speed consistent with accuracy and with a fullness limited only by the requirements of national security. The government's policy was explained by ministers of the crown, and nearly every aspect of the country's effort must have been described by expert speakers during the course of the year. At the same time, the nation's need for entertainment and recreation was seen to be as insistent as ever it had been in days of safety. The BBC did its best, with music, plays, variety and light features of all kinds, to reflect and reinforce the people's mood of stubborn cheerfulness.

BBC news observers, often accompanied by mobile recording units, described the war in Finland, on the western front, in the middle east, at sea and on the home front. Outstanding among these were a running commentary by Charles Gardner on an air battle at Dover, air raid experiences by Robin Duff, the evacuation from Calais vividly described by Vice-Admiral Sir James Somerville, descriptions of the evacuation from Dunkirk, and talks by R.A.F. pilots of raids on enemy territory and of air battles over Britain.

The king broadcast twice to the peoples of the British commonwealth; the queen spoke on the anniversary of the Y.W.C.A. and again on June 14, speaking in French to the women of France. Princess Elizabeth made her debut at the microphone when she inaugurated a children's feature for North American transmission.

Special mention should be made of the dramatic two-minute broadcast on June 17 when Mr. Churchill announced to the world Britain's determination to carry on the struggle though France withdrew. Another important broadcast was the one given by the prime minister on Oct. 21, when he spoke in English and French to the people of France. General Smuts, prime minister of South Africa, broadcast from Cape Town on July 21. Speeches by President Roosevelt were also relayed to listeners in Great Britain.

Entertainment programs inevitably reflected war conditions, notably the more serious turn of events in the spring, when sporting commentaries were dropped. The war effort was put before listeners in dramatic form, outstanding among such programs being the dramatization of the exploits of the Polish and British submarines "Orzel" and "Salmon," also the reconstruction of raids over Germany and the defence of Britain in two programs entitled "Bombers Over Germany" and "Spitfires Over Britain." Music occupied a large proportion of program time. The BBC Symphony orchestra gave a number of public concerts, as did also the BBC Theatre orchestra.

School broadcasting, adapted to conditions arising from evacuation, continued throughout the year. Innovations were the introduction on July 1 of a ten-minute news commentary for children and on Sept. 13 of a weekly short religious service for schools.

Broadcast experimentally from January during the evenings only, the program for the forces in June was extended to include

transmissions between 6:15 A.M. and 8 A.M., as well as a 12-hour service from 11 A.M. Designed for listening at the front, the program was planned after comprehensive research among the forces. After the evacuation of the British expeditionary force from France and Belgium, the program was continued in order to meet the needs of men and women on active service at home.

By the autumn of 1940 the BBC in its overseas services was broadcasting in 30 languages as compared with 19 on Dec. 31, 1939. The BBC's aim was to provide frequent news bulletins and talks of vital topical interest with the widest possible area of reception, to carry to neutral countries the British and Allied case, and to gain listeners among the German and Italian peoples. As a result of Germany's conquest of Denmark and Norway, and later of Holland, Belgium and France, the BBC alone remained to keep free broadcasting alive in western Europe. Facilities were at once extended by the BBC to Allied governments in London, and services were expanded in co-operation with them. Queen Wilhelmina, King Haakon, President Beneš and General Sikorski were thus enabled to address their oppressed peoples. In the BBC French service on June 18, 1940 General de Gaulle appealed to all free Frenchmen to continue the struggle by the side of Britain. In addition to the European service, there was the world service, incorporating the former empire service, and also the service including Turkish, Arabic and Greek for the near east, Afrikaans, and the Latin-American programs. In May a series of talks was started for listeners in the U.S.A. From this a North American service, incorporating that previously provided for Canada, Newfoundland and the West Indies, was being developed and was proving acceptable to listeners across the Atlantic. (See also ADVERTISING.)

Radio, Scientific Developments of. The scope of radio and the applications of the instrumentalities that were first developed for use in radio communications continued to expand. So also did radio communication itself. The extensions of the year 1940 involved not merely increased uses of old techniques, but the adoption of new scientific developments in both new and existing services. Wartime requirements directly affected transoceanic radio, and, to a lesser extent, the operation of radio in North America.

In long-distance radio, the occupation in war of European nations resulted in the ending of some services and the modification of others. Yet the demand for rapid and dependable communication between the continents naturally increased. Requirements for improved traffic capacity and the probability that messages and pictures would have to be exchanged in still greater volume during 1941, put emphasis on the adoption of facsimile as a means for increasing the accuracy and the word-carrying capacity of the available channels. In addition to providing for transmission of text at speeds of several hundreds of words per minute, the combination of facsimile and of photo-radio with some of the newer devices for overcoming or mitigating the disturbing effects of fading and multipath transmission, made possible the transoceanic and transcontinental delivery of pictures and photographs with considerably improved quality and speed. While the obvious immediate gain from the availability of such new facilities was had in the handling of business and press messages and of news pictures, these everyday advantages might eventually be overshadowed by the military value of such high-speed radio services across the oceans.

Radio transmission over short distances, say from hundreds of yards to hundreds (rather than thousands) of miles, was marked by the improvements in ultra-high-frequency tubes and accessory apparatus, by the further adoption of frequency modulation as a

means for minimizing interference, and by the development of special terminal equipment for particular uses. New wave-generating and control systems made it possible in 1940 to develop higher radio-frequency power levels at far higher frequencies than ever before, and thus to communicate by telegraph, telephone or facsimile over greater distances than were previously thought to be within the capacity of the exceedingly short "micro waves." In this way entirely new fields for civil, military and emergency radio services were opened. The use of such extremely high frequencies, measured in hundreds or even thousands of millions of vibrations per second, facilitated the application of frequency modulation to the communication systems, with consequent extension of service distance and reliability under severe interference conditions. During 1940 these new developments were adopted for certain police networks, and it was reported that they were even more extensively applied in the military field; civil applications would doubtless follow.

In radio broadcasting, aside from television, the most notable features appear to lie in the recognition of frequency modulation as a service and in the increasing development of short-wave international transmission for news, information and propaganda. In May 1940 the U.S. Federal Communications commission designated 40 new channels, in the range from 42 to 50 megacycles, for regular broadcasting using frequency modulation, and shortly thereafter issued regulations designed to establish this new supplemental broadcast service on a basis that would provide improved freedom from interference. Pursuant to these provisions, new broadcasting stations were under construction in many parts of the United States; four were in regular daily operation in New York city and a number of others were to be erected. The new system of broadcasting also aroused interest in Canada, and stations were announced for early construction in Montreal and Toronto. On the basis of the experimental operations and developments of 1940, it would seem probable that the new broadcast services will not only provide additional programs and services to broadcast listeners, but will tend to relieve the congestion that has degraded the existing standard broadcast services. In some quarters the view was expressed that frequency modulation broadcasting will, in the course of perhaps a decade, entirely supersede the standard methods; it seemed more likely that the two will progress together, each supplementing the other and each taking precedence in the portion of the field that it is best fitted to serve.

Turning to international short-wave broadcasting, one finds that its political importance was heightened by the war. Of all the nations which used the short waves to reach their citizens overseas and to impress their particular cultural and other developments upon all who would listen to their programs, perhaps the Latin-American republics were most prolific. Technically, however, the British and the Germans developed and maintained the most comprehensive overseas radio services. During 1940 the United States government established new and higher scientific standards for the international stations licensed within its borders, so that it seemed probable in 1940 the reception of programs originating in North America and heard in Europe and Latin America would be placed on a parity with the best in such long-distance broadcasting.

Three other scientific developments in radio should be mentioned. One is the new "camera size" or personal broadcast receiver which attained such great popularity during the year. This easily carried, self-contained, battery-operated device was made possible only by the development of a completely new line of miniature vacuum tubes of high efficiency; it is looked on as possibly the forerunner of similarly portable two-way radio telephones that may ultimately provide us with person-to-person communication by radio. A second is the improved facsimile recording apparatus that has been developed, and which has so greatly increased operating speeds that at least three times as much text or pictorial material can be transmitted in a given time; 48 sq.in. of "copy" are recorded in black, on white paper, every minute that one of these new machines is in operation. Finally, there is the "electron microscope," which has been adopted by a number of research centres to provide magnifications far greater than possible with the best optical instruments. This, of course, is not strictly a radio device but it is built upon radio developments and is an interesting example of how advances in one field can contribute substantially along a still wider scientific front. (See also ADVERTISING; AIRPORTS AND FLYING FIELDS; RADIO, INDUSTRIAL ASPECTS OF; TELEVISION.) (J. V. L. H.)

Radium. The bulk of the world's radium production centred in 1940 around the outputs of the Belgian Congo and Canada, and by agreement between the producers the market was divided in a 60:40 ratio. No data were available on production in either country, but from statements of the receipt of concentrates at the refinery, it is estimated that Canadian production was of the order of 55-65 grams annually, and on the basis of the market agreement it would be anticipated that the Congo output was about 100 grams. Ores produced in the United States in 1939 contained almost 8 grams, but as production is primarily for the vanadium content of the ore, it is not known how much of the radium was recovered. A still smaller output was made in Czecho-

slovakia, which is scheduled for expansion since the territory came under German control

The United States imports increased heavily, to 38.75 grams in 1938 and 70.49 grams in 1939, but dropped back to 28 grams in the first 10 months of 1940.

The war raging in Europe had extensive repercussions on the radium industry that reached far beyond the ordinary disturbances in transportation that affected all products involved in international trade. The refinery in Belgium, to which the Congo ore was shipped for treatment, fell into German hands with the occupation of Belgium, and this necessitated new arrangements for ore treatment, or the temporary satisfaction of the entire demand by Canadian supplies, supplemented to some extent by the minor sources.

A further problem had to be met in England, where, to avoid loss by bombing, and subsequent harm to those frequenting an area where appreciable amounts of radium might have been dissipated by an explosion, hospitals transferred their radium supplies to a remote cave or excavation, where the radium emanation was collected and sent back to the hospitals for treatments. (See also VANADIUM.)

(G. A. Ro.)

Railroad Accidents: see DISASTERS.

Railroads. The railroad record of 1940 was influenced favourably by several factors. Earnings were greater than in any year since 1930 in gross and since 1936 in net. The quality of service was better than ever before. In technical efficiency new high records were established, with freedom from strikes or other serious labour controversy. Substantial progress was made in financial reorganization of properties in the hands of the courts. Not affecting the operating results of 1940, but of importance from the long-time viewpoint, the passage of the new Transportation act (Sept. 18) held out promise of a more equitable basis of competition with other forms of transportation.

On the unfavourable side it should be noted that the improvement in volume of rail traffic was due in large part to activities, more or less temporary, of the national defence program. The competition with other forms of transportation continued in greater intensity. The 1940 Transportation act might have but slight effect on competitive relationships with trucks, pipe lines, buses and aeroplanes, and even though it, for the first time, provided for comprehensive regulation of interstate transportation by vessels on the inland and coastal waterways, the extent of

A "JOUNCELESS" RAILROAD CAR resting on high springs above a low centre of gravity was exhibited in 1940

such control was not as great as the railroads had desired. The revival of the St. Lawrence river power and navigation project was a serious threat, both in potential diversion of rail traffic and in curtailing the movement of coal. And, finally, the reorganization of the weakest railroads, which became bankrupt during the first years of the depression or earlier, could not solve the financial problems of the substantial number which barely escaped bankruptcy and were still weak financially. About 30% of the total mileage failed to earn all fixed charges in 1940.

The condensed income account in Table I affords comparisons of 1940 with the prosperous pre-depression year of 1929, the lowest year of the depression (1932) and the year 1939; the figures for 1940 are partially estimated.

Table I.—Operating Results, Class I Railroads,
1929, 1932, 1939 and 1940 (U. S.)
(In millions) *

	1929	1932	1939	1940	Per cent of 1929		
					1932	1939	1940
Operating revenues	\$6,279	\$3,127	\$3,995	\$4,275	50	64	68
Operating expenses	4,506	2,403	2,918	3,090	53	65	69
Taxes	397	275	356	405	69	90	102
Net ry. op. income	1,252	326	589	650	26	47	52
Net income after charges	897	139*	93	155	*	10	17

*Deficit.

It is difficult to estimate how much of rail freight traffic in 1940 was attributable to the national defence program, but it doubtless had predominant influence. While that program continues the railroads will profit by the additional tonnage. Conversely, when that program is curtailed railroad earnings will be less.

It is not safe, therefore, to rely on immediately prospective earnings as evidence of permanently renewed railroad vitality. The earnings of transportation companies, collectively, rise and fall in degree corresponding closely with the fluctuating intensity of industrial activity.

In improvement in speed of passenger trains, and convenience and comfort of equipment and facilities, notable progress was made. During 1940 27 new high-speed passenger trains with modern streamlined equipment were added and 17 additional trains of that kind were under construction. Freight service likewise was expanded and quickened. One day or more was taken off the transit time of freight service by rail between many important cities.

Competition had effect also upon passenger fares and freight rates. The reduction of the rate in railroad coaches from 2½ cents to 2 cents per mile was ordered by the ICC in March,

overruling the railroad desire to maintain the higher rate. With respect to freight rate reductions, however, the initiative was taken by the railroads and the commission's activities were mainly to restrain the railroads from going too low. The average revenue per passenger-mile in 1940 was about 1.75 cents, in comparison with 1.84 cents in 1939 and 2.81 cents in 1929. The average revenue per ton-mile in 1940 was about 0.95 cents, in comparison with 0.973 cents in 1939 and 1.076 cents in 1929. It should be noted, however, that the diversion of the higher rated commodities from rails to trucks tended to reduce the rail average because the lower rated commodities became a larger part of the total.

In technical efficiency the railroads set new high records. Table II indicates the degree of improvement in a few units.

Table II.—Technical Efficiency of U. S. Railroads

Item	First 10 months of		Year 1929
	1940	1939	
Ton miles per serviceable freight car day . . .	657	601	582
Revenue tons per freight train . . .	850	800	804
Freight train speed (m.p.h.) . . .	16.7	16.7	13.2
Gross ton miles per freight train hour . . .	33,856	32,704	24,539
Coal burned per 1,000 gross ton miles (lb.) . .	111	112	125

In 1940 a large part of the deferred maintenance of locomotives and cars was made up and many new freight cars were purchased or were on order. The assurance of the railroad executive officers that the railroad plant and equipment were adequate to take care of the extra transportation demands of national defence appeared to be reasonably sound.

At the beginning of 1940 there were 77,013 mi. of railroads in the hands of the courts for financial reorganization. At the end of the year the mileage was 72,907. Three Class I properties were transferred from receivers or trustees to the owners of the reorganized companies and several other Class I properties have reached the final stages of reorganization. It appeared that the effects upon the reorganized properties would be drastic reduction in bonds on which interest must be paid, the conversion of part of former fixed interest bonds into income bonds on which interest would be paid only when earned, the conversion of junior issues of mortgage bonds into income bonds and preferred stock, the total or partial elimination of former stockholders and the issuance of new stock to the creditors. It seemed that total interest charges, fixed and contingent, would be reduced about 50%.

The passage of the Transportation act of 1940 culminated efforts, extending over several years, to amend the Transportation acts of 1920 and 1933 and to recognize changed conditions. The more important features of the new law are:

(1) The declaration, for the first time, of a national transportation policy of fair and impartial regulation of all forms of transportation so administered as to preserve the inherent advantages of each; promote safe, economic and efficient service; foster sound economic conditions in transportation and among the several carriers; prevent unfair and destructive competition; and encourage fair wages and working conditions; (2) the transfer of the regulatory powers over water transportation from the Maritime commission to the Interstate Commerce commission and the expansion of those powers so that the regulation of interstate water carriers will be nearly as comprehensive as that of railroads and motor carriers; and (3) the creation of a new Transportation board, with limited life, to investigate and report to congress on the relative economy and fitness of carriers of all types; to determine the service for which each type is especially fitted or unfitted; to suggest the methods by which each type can and should be developed; to determine the extent of subsidy or other public aid; and to consider the fairness and adequacy of taxes.

In addition to the three new features above mentioned, the new law amended many sections of the old law so as to bring about approximate uniformity in the regulatory burden on each form of transportation except air. The new law did not apply to air carriers. (W. J. C.)

Europe.—Existing abnormal conditions in 1940 in Europe and adjoining continents make it desirable to treat railway activities in wartime separately from normal railway progress outlined hereunder.

Great Britain.—Normal renewals and developments on the British railways had to be severely curtailed after early summer and work was stopped on the extensions of the London tube railways to northeast and northwest London, owing to the difficulty of obtaining materials and to the

necessity of diverting labour to more essential war work. This program was due for completion about 1941, as was the electrification of the London and North Eastern main line between Sheffield and Manchester, and the same railway's suburban electric service to Sheffield was also temporarily suspended. The London Midland and Scottish railway placed in service on its Liverpool-Southport electric line some new multiple-unit type cars, providing in three cars 268 seats on only 89 tons. First class travel was abolished on nearly all the electric trains of the London Passenger Transport board in February; new cars of a unique design started work on the Southern railway's Waterloo and City tube. London Transport's electric trains were extended over the London and North Eastern railway line to High Barnet in April, marking a further step in the £40,000,000 improvement program of 1935. The Central London tube had been completely modernized, a very intricate engineering feat as the line was kept open. The Great Western railway's success with 18 diesel railcars, which had run over 3,000,000 mi., resulted in a further 20 of an improved design being ordered for completion in 1940. Easter rail travel, in spite of the war, was stated to be a record one. The equipment of many stations with loud speakers for directing passengers proved extremely useful under the existing difficulties, and after many tests a satisfactory system of lighting was devised which permits of reading without infringing the "black-out" regulations: fluorescent lighting was tried with success for the train indicator at Paddington, Great Western railway. Under war conditions some of the express passenger trains have carried enormous loads; on April 3, the "Flying Scotsman" consisted of 22 coaches, weighing 703 tons; on the London Midland and Scottish railway, trials with electrically heated snow melters for points were successful.

France.—The French National railways had placed orders for 31,000 wagons to be delivered in 1940, and a further 20,000 in 1941, but the effect of France's surrender was not in 1940 known. Conversion of the Brive-Montauban and Paris-Dijon main lines to electric traction has been authorized when finances permit.

Germany.—In Germany a four-year program of rolling stock construction was undertaken, but most of the activities of the railway related to the land campaigns of the army. During the winter 1939-40 a series of 12 accidents took place in which 442 lives were lost.

Other European Countries.—The Italian State railways placed in service between Rome and Calabria a new six-car train constructed almost entirely of aluminium, thus greatly reducing the weight per car; conversion to electric traction continues. Albania was to have a railway, running from Durazzo to Labinoti via Elbasan.

In Switzerland the last remaining single line section of the famous Gotthard, between Fluelen and Brunnen, was being widened, but the work was of considerable magnitude. The Swedish State railways were energetically pressing forward their electrification program, including the Laangsele-Boden 312-mi. section of the East Coast railway. When completed electric traction will be continuous between Stockholm and the Lapland ore railway from Lulea to Narvik, on which electric traction was inaugurated in July 1914. The year 1940 saw the completion of a vital rail link in Vaestergoetland between Ulricehamn and Joenkoeping. In the Great Belt and Baltic services were badly interrupted by ice floes in the early spring. Progress, in spite of the war, has been made with the extension of the Norrland railway which has been opened as far as Mosjoen. The Portuguese National railway imported some of the famous Budd type stainless steel lightweight coaches from Philadelphia during 1940. Lithuania, which was making rapid progress with the reconstruction of its railway system after taking over Vilna, was later forced to hand over the control of its railways to the U.S.S.R. Many new lines have been completed in the European territory of the U.S.S.R., a typical example being that from Chelyabinsk in the Urals to Snarskaya, 93 mi., thus linking industries around Orsk with Western Kazakhstan. New lines have also been constructed joining the Murmansk railway to the Finnish railways.

Asia.—On July 17, 1940 the first passenger train left Baghdad to traverse the final link of the so-called Baghdad railway between Mosul and Baiji; the train was to continue to Haidar Pacha and thus was achieved a scheme first conceived in the 1850s prior to the incorporation of the Suez Canal company in 1856. The through route traverses Iraq, Syria and Turkey, and, being built to standard gauge—4 ft. 8½ in.—would enable through trains to be run from London, Paris, Berlin and Rome to Baghdad, if a tunnel or train ferry is later provided as a means of crossing the Bosphorus. Construction work proceeded apace on the Iranian government's new standard gauge line between Teheran and Tabriz, the 90-mi. section from Teheran to Kazvin having been opened in March 1940. This line will be linked with the Russian and Turkish railways. In India the progressive Nizam's state railway placed in service some diesel railcars equipped with air-conditioning. Several new types of locomotives have been placed in service, some of which have been built in India. The Great Indian Peninsula railway now uses a track recording car and welded 210-ft. rails are being laid. In Malaya considerable progress is recorded in the correlation of rail and road services. Railway construction continued rapidly in the east, both in the U.S.S.R. and in Japanese-controlled China, Manchoukuo and Chosen. A typical example was the completion of the Tailing-Tangyuan line of 83½ miles on May 1.

Other Continents.—**Canada.**—Great increases of traffic and industrial production have vastly improved the finances of the two Canadian railway systems; on the Canadian National railways the net revenue for the first eight months rose by \$24,000,000. Both railways have ordered many additional locomotives and other rolling stock, including novel designs of refrigerators.

South America.—There were few major developments on South American railways; it is not possible to record any improvement in the financial position. Diesel railcars and air-conditioning were two forms of progress which proved popular and were being extended.

Africa.—The South African railways were carrying out various deviation schemes, as in the East London area, thereby reducing heavy gradients on main lines and easing curvature. A large rolling stock three-year program, including 500 coaches and 8,000 wagons, was started. In Nigeria the appointment of director of transport was abolished, originally conceived to achieve co-ordination of transport facilities. New Garratt type loco-

motives have been introduced on the Rhodesian railways; in Nyasaland a line was being built in 1940 between Tete and Baue.

Australasia.—Railway construction continued slowly in Australia and New Zealand; for example, in the Sydney area and at Maryvale in New South Wales. At Sydney certain extensions to the suburban electrified network were completed. In New Zealand the railways earned a record revenue in 1939-40 and many additional express locomotives were acquired.

Railways in Wartime.—Communications were playing a part unparalleled in any previous war. Rail transport has been one of the main keys to all offensive actions. German successes have been due in large part to ability to paralyze by air interference enemy lines of communication and, consequently, railway centres and the harbours and docks which feed them have been subjected to grievous bombing. Rotterdam was one of the first instances in 1940, closely followed by Antwerp, Rouen, Le Havre, Nantes and Brest. Railway communications have suffered in Germany, notably such nerve centres as Hamm, Cologne, Mannheim, Berlin, Hamburg and Bremen. In the belligerent countries railway activities have been mainly concentrated on the war effort.

Great Britain.—Evacuation of children from the larger cities had taken place on a large scale in 1939 and the first unexpected load of magnitude to be faced in 1940 by the four British railways accrued in respect of the movement of the British army from Dunkirk to England early in June, in which many railway-owned steamers played a notable part. Without any notice 620 special trains carrying 300,000 passengers distributed these men throughout Great Britain from the ports between May 27 and June 4. The evacuation of 110,000 London children between June 13 and 18 required 180 steam trains, 180 electric and tube trains, 1,300 buses and 200 trams and trolleybuses. Great Britain itself becoming a war zone imposed many additional tasks on the railways in connection with the building up of an immense army, the protection of all vulnerable points, such as bridges and signal cabins, the diversion of some additional traffic from coastwise services to the railways and further large evacuation schemes, more particularly after indiscriminate bombing of London and other large cities started. The necessity of having large coal stocks near consuming centres, together with diversion of coal traffic from normal routes, owing to changing overseas and home markets, imposed a further heavy task. In one week 255,000 coal wagons were moved by rail and 2,200 extra coal trains ran between February and June. To some extent passenger services were reduced, but the real period of trial came with the intense air bombardment by day and night during September. Few sections of line were out of service for more than a few days at most and London benefited by its multiplicity of alternative routes and enormously by the full co-ordination of its railway, bus and trolley services, achieved through the pool arranged some years ago between the mainline railways and the London Passenger Transport board. The replacement of railway services by buses at a few minutes' notice proved the enormous value of rail and road co-ordination.

France, Belgium, Holland, Norway, Denmark and Poland.—Railway working in these territories occupied by Germany has been carried on, where it was physically possible, under the direction of German railway officials; civil traffic formed a very small proportion of train mileage; despatch of captured foodstuffs, livestock, materials and armaments to Germany was given priority over all but military traffic. Restrictions on passenger travel were very rigid; lack of oil products forced the withdrawal of railcars and diverted road traffic to the railways. The German authorities have proved extremely efficient in repairing damaged bridges and other essential railway facilities, adequate training and preparations for the work having long been in hand. Thus, in Holland replacements of damaged bridges arrived shortly behind the first wave of troops, as had occurred in Poland.

Germany.—The events of 1940 have borne witness to the remarkable efficiency of the German railway system, a point long recognized by all technical experts. Originally constructed with strategic aims in view, the Nazi regime has developed the system along two main principles—social service and war needs, irrespective of financial results and lack of return on capital. The railway systems of Sudetenland, Bohemia-Moravia, German-occupied Poland and Alsace-Lorraine were (1940) operated as sections of the German railway, and the services closely interlocked with those of occupied territories stretching to Irún, on the Spanish frontier, Brest and the channel ports in the west and Bratislava (Slovakia) and Przemyśl in the east. Hard pressed by unparalleled cold weather in the spring, which closed navigation on the Danube and other waterways of central Europe for long periods, the strain on German rolling stock, especially wagons, proved crucial, but the position was relieved by the acquisition of rolling stock from occupied territories, particularly France. Nevertheless, increased hauls for traffic within and across Germany, such as the despatch of 1,000,000 tons of coal a month by rail to Italy, imposed a serious strain on Germany's railway system, and, with its delicate working upset to some extent by war damage, it remained one of the keys to the entire war situation.

Italy and the Balkans.—Italy's entry into the war imposed on the Italian state railways a load for which they had long prepared, but which they remained comparatively ill-equipped to carry. Electrification has served to ease the problem of coal supplies, but electric traction was itself highly vulnerable to interference, being dependent on centralized sources of power. Comparative shortage of oil and gasoline enforced reduction of railcar services, extensively developed in Italy, but coastwise services have been used to distribute coal and relieve the railways' burden. While Greece, Yugoslavia, Hungary, Bulgaria and Rumania had retained their neutrality up to Oct. 1940, considerable pressure had been brought to bear upon them to act as feeder services to the Italian and German railway systems. Oil traffic from Rumania and from the U.S.S.R. via Bulgaria passed in large quantities to Germany and later to Italy, supplementing the water route up the Danube to Bratislava, Vienna and Regensburg. Tobacco from Greece, ore from Yugoslavia and grain from Rumania, which had previously gone by sea, have had to be routed by rail across Europe.

U.S.S.R.—Even excluding the occupation of eastern Poland and the Finnish war, the Russian railway system has been materially affected by hostilities in western Europe. Its trans-Siberian route has had to carry

an unprecedented volume of traffic and has suffered from congestion at Vladivostok and Manchouli, the frontier with Manchoukuo. Oil and other traffic from the Baku region has created considerable congestion at Batum, whence much is shipped to western Black sea ports. After taking over northern Bukovina and Bessarabia from Rumania, the standard gauge was converted to the Russian five-foot gauge, a policy which had been applied also in occupied Polish territories and which was completed by the middle of 1940. The railway systems of Estonia, Latvia and Lithuania became a part of the U.S.S.R. network after the absorption of these countries in 1940. Ralston, James Layton (1881—), Canadian statesman and member of the war cabinet. He was born Sept. 27 at Amherst, N.S., was graduated from Dalhousie law school and was called to the bar in 1903, after which he practised law in Nova Scotia. In 1916 he went to France as a major of the 85th Canadian infantry battalion, which he commanded from April 1918 until its demobilization in June 1919. He was awarded the Distinguished Service order with bar, made a Companion of St. Michael and St. George, and was mentioned twice in dispatches. In 1924 he was gazetted colonel. He accepted the portfolio of minister of national defence in the federal cabinet in Oct. 1926 and was elected to the house of commons by acclamation the next month. In 1930 he was a delegate to the London naval conference and was again elected member of parliament from Nova Scotia in the elections of that year. With the defeat of the Liberal party in Aug. 1930 he resigned and resumed the practice of law at Montreal. On Sept. 6, 1939, he was appointed minister of finance in the King cabinet, and on Jan. 2, 1940, he was elected by acclamation to the house of commons as a Liberal member for Prince Edward island. After presenting the second war budget June 24, 1940, he took over the portfolio of minister of defence, left vacant by the death of Norman McLeod Rogers (q.v.).

Rautenburg, Robert (1857-1940), German-American sculptor, was born in Silesia, Germany. He studied wood and stone carving in Berlin, Paris, Vienna and Rome. He assisted in excavations at Pompeii and Herculaneum and restored many broken statues. He later specialized in ecclesiastical sculpture, doing work for churches in Vienna, Berlin and Paris. He went to the United States in 1887 and worked with Saint-Gaudens and Grafly. He did the statuary work for the main staircase of the Congressional Library in Washington and for several U.S. churches. He died in Arden, Del., Feb. 21.

Rayburn, Sam (1882—), U.S. legislator, was born Jan. 6 near Kingston, Tenn., and was graduated with a bachelor's degree from East Texas college. He studied law at the University of Texas, then began practice at Bonham, Tex. After four years as a member of the Texas house of representatives and two years as speaker of the house he was elected to the U.S. congress, of which he has been a member since 1913. A close friend of President Roosevelt, he was elected Democratic majority leader of the house in 1937 and in this office was responsible for the steering of much New Deal legislation to successful completion. On Sept. 16, 1940, Rayburn was elected by acclamation to succeed the late William B. Bankhead (q.v.) as speaker. He was succeeded as majority leader by Representative John W. McCormack of Massachusetts.

Rayon. World rayon production again showed an increase in 1940 over all previous years, chiefly in production of rayon staple fibre. In 1940, of the total 2,500,000,000 lb. produced, 1,350,000,000 lb. were staple fibre and 1,150,000,000 lb. filament yarn. (The 1939 production showed 2,227,000,000 lb. as a total with staple yarn at 1,082,000,000 lb. and filament yarn at 1,145,000,000 lb.) For the first time, the relatively new staple yarn exceeded filament yarn in production. To a large extent, this was the result of German concentration upon a fibre that more nearly resembles cotton and wool than filament yarn and is less expensive to make. The other axis powers shared in this growth but not to the same extent. Japan remained at about the same level but Italy showed some increase. A cheap synthetic fibre that can be produced in large volume and give the soft warm effect of the natural fibres no longer available is the answer to the needs of countries cut off from world trade. At the same time, rayon filament yarn world production decreased sharply as it was considered more of a luxury product.

In the United States, not only staple fibre but filament yarn showed a marked increase. The combined production of U.S. rayon filament and staple fibre represented over a third of the world's total supply, the first time that one country has accounted for such a large share. Rayon filament yarn produced in 1940 amounted to 390,100,000 lb. compared with 329,600,000 in 1939. Staple fibre rose to 81,100,000 lb. in 1940 from 51,300,000 in 1939. Rayon has virtually become the fibre used in the great mass of garments and household textiles that formerly employed cotton, silk and wool. Silk had already lost its markets in garments but wool recorded an increasing loss to rayon during 1940. Mixed wool and spun rayon fabrics for men's clothing, especially, became more established. At the same time, all spun rayon (staple fibre) fabrics continued to supply people of low incomes with well designed so-called sportswear or tailored type clothing formerly found only in fairly high priced woollen garments.

Spun rayon blankets were introduced widely during 1940. They were offered for their lightness and attractive colouring, as well as their price, which was lower than that of woollens of the same weight and texture. Brushed surface rayons made from the staple fibre continued to grow in favour for children's clothing and adults' sportswear. In household linens, rayon towels were featured both in imitation of the linen weave and the rougher "turkish" textures, and the rayon tablecloth became commonplace.

Price movements of the other textile fibres and rayon showed an interesting difference in trend. Other fibres fluctuated widely at times (notably wool in 1940, presumably because of defence orders), but rayon showed little or no change. After Oct. 1939 the average monthly price of rayon yarn remained at 53 cents. In the same period, raw wool was \$1.14 in Oct. 1939, dropped to a low of 88 cents in July and Aug. 1940 and increased to \$1.10 by Dec. 1940. Raw silk was \$3.24 in Oct. 1939, rose to \$3.89 in Dec. 1939 and dropped to \$2.55 by Dec. 1940. The comparatively stabilized price of rayon, as contrasted with both silk and wool, combined with satisfactory wear and appearance, is one of its chief attractions for the manufacturer of rayon products and is an important factor in assuring its further progress.

While not strictly termed rayon or rayon manufactures, reference should be made to the 1940 development of so-called plastics, or synthetic fibres made from a plastic base. Most notable was nylon, for its use in hosiery, but vinyon was entering actively into the commercial consumer market during the last six months of 1940. The first public sale of nylon hosiery was on May 15, 1940 and the demand was so great that stocks were exhausted rapidly. Prices for nylon hosiery were substantially higher than for silk but by Dec. 1940, after seven months of consumer experience, manufacturers were allotting deliveries to retailers by

RAYON AND RAW SILK consumed in the United States

stipulating that a proportionate amount of silk hosiery must be purchased to secure nylon. Retail prices of nylon hosiery ranged from \$1.35 to \$1.95 a pair, as contrasted with an average price of about 85 cents for silk. Nylon for fabrics was still in the experimental stage, largely because of the limited supply of yarn for the mills. Both in laces and velvets, however, nylon was featured for its superior elasticity and resistance to pressure.

Vinyon was introduced to the public during 1940 in a glove fabric and in felts for hats. This is the fibre that, during the previous two years, had been used in industrial filter cloths, because of its resistance to mineral acids and alkalis, as well as its high strength, both wet and dry. Like nylon, vinyon does not absorb moisture. Dirt and stains do not penetrate and are easily removable in washing; nor do the fabrics shrink. Quick drying properties are an added asset in these two new fibres.

Use of rayon and other synthetic fibres in military and naval equipment, in 1940, was primarily in experiments to take the place of imported fibres or those limited in supply. Nylon parachutes to replace the silk fabric were in the process of practical test by the army. Fiberglass to cover aeroplane wings was used in educational contracts because of its fireproof quality and light weight. Fortisan, considered by some military authorities as superior even to nylon and vinyon, was another of the new synthetics being tried in parachutes. In clothing, rayon linings were substituted for cotton or silk in flying cadets' uniforms and experimental spun rayon and wool combination fabrics for uniform use were ordered by army officials. With the exception of cartridge bag cloth, all silk articles, including sewing thread, were in the process of being replaced by one or another of the synthetic fibres. Wool still held its own but, as noted, experiments were under way to utilize in uniforms and other garments, normally specifying the natural wool fibre, a combination of wool and spun rayon or all spun rayon fabrics which have already proved their worth in men's sportswear. Civilian use for rayon, however, was felt to be the most valuable contribution of the synthetic fibres to defence purposes. Use of rayon would mean that production of textiles would be a wholly domestic industry since the raw materials for rayon were produced in the United States and all subsequent processing plants were located in the U.S.A. Second, with a rising cost of living and greater tax drain upon the population to pay the cost of defence, the use of rayon, with its lower cost, would naturally help in solving the average customer's budget. Reconstruction Finance Corporation,

one of several agencies comprising the Federal Loan agency, under the supervision of the Federal Loan administrator, may perform all functions it is authorized to perform under law to close of Jan. 22, 1947, or such earlier date as the president may authorize. It was created by "an Act to provide emergency financing facilities for financial institutions, to aid in financing agriculture, commerce, and industry, and for other purposes," approved Jan. 22, 1932, which may be cited as the "Reconstruction Finance Corporation Act." The powers of the corporation were increased and the scope of its operations extended or otherwise affected by

Reconstruction Finance Corporation—Summary of Activities Feb. 2, 1932 through Dec. 31, 1940

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture	\$ 2,604,071,430.83	\$ 1,450,650,426.06	\$1,446,851,462.93
To open banks to meet demands of depositors	1,334,787,161.08	1,138,233,619.27	1,075,668,017.61
For distribution to depositors in closed banks	1,388,624,715.93	1,032,190,862.01	964,900,120.65
For bank capital (including Export-Import Banks)	1,544,502,689.00	1,243,185,206.56	680,473,957.46
For self-liquidating projects (including PWA municipal securities)	1,142,982,665.94	903,415,464.47	757,144,082.06
To business enterprises	570,795,629.02	240,118,867.51	118,302,757.18
For loans for national defence	913,884,108.55	63,707,398.39	320,797.34
For purchases of stock—national defence	20,000,000.00	13,000,000.00	
To drainage, levee and irrigation districts	140,861,808.39	90,850,363.04	73,399,559.59
To railroads (including PWA railroad securities)	1,454,597,165.54	985,888,344.70	499,716,606.05
For loans to and capital of mortgage loan companies (including \$25,000,000 capital the RFC Mortgage company and \$11,000,000 capital Federal National Mortgage association)	708,904,275.19	545,949,045.24	356,408,334.45
For loans to and capital of insurance companies	138,914,750.19	125,168,209.81	100,555,062.06
To building and loan associations (including receivers)	104,700,533.45	122,657,241.60	118,380,062.96
To public school authorities	25,297,050.00	22,865,175.00	22,300,000.00
Catastrophe rehabilitation loans	16,184,520.95	12,003,055.32	10,768,972.92
To state funds for insurance of deposits of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses	16,563,100.00	6,490,409.40	2,713,696.95
For other purposes	669,957.07	614,813.85	603,739.27
Total—By directors of the corporation	\$12,199,428,377.01	\$ 8,010,053,133.41	\$6,181,589,851.66
Allocations and loans to other governmental agencies and for relief by direction of congress	3,204,398,637.69	2,956,946,055.33	2,782,448,480.79†
GRAND TOTAL	\$15,403,827,014.70	\$10,966,999,188.74	\$8,964,038,332.45*

*Includes \$36,566,518.72 credited on indebtedness for property taken over for debt.

†Includes \$2,728,286,823.03 cancellation of corporation's notes pursuant to act of congress approved Feb. 24, 1938.

subsequent legislation.

The corporation was organized and began operations on Feb. 2, 1932.

(E. SM.)

Red Cross. The Red Cross is the internationally recognized symbol of agencies in most countries for relief of sufferers in war and civil calamities. The agencies operate under the International Red Cross formed in Geneva in 1864 to which 63 national societies are signatory to organize impartial aid for sick and wounded in time of war, and the league of Red Cross societies with headquarters in Geneva which specializes in peacetime relief work.

The American Red Cross was organized in 1881 and signed the Geneva convention in 1882. It carries on extensive disaster relief operations and, since founding, has expended \$144,000,000 to aid the victims of more than 2,600 disasters the world over. It is supported entirely by public contributions and has never been government financed. It sponsors the American Junior Red Cross with a school boy and girl membership of 8,588,398 and since 1914 has awarded life saving certificates to more than 1,075,000 persons completing training courses, and since 1910 more than 2,460,000 certificates to persons instructed in first aid technique. Certificates have also been issued to more than 1,073,000 women and older girls who have taken Red Cross instruction in how to care for the sick at home.

To combat accidental injuries and deaths the American Red

Cross has established almost 6,000 emergency highway first aid stations and mobile units, and annually gives instruction to approximately 10,000,000 householders on the removal of hazards likely to cause home and farm accidents.

In 1939-40 the American Red Cross provided food, clothing, shelter, rescue, medical and nursing aid and rehabilitation assistance to more than 100,000 victims of 102 disasters in the United States at an expenditure of \$655,758.

During the same period Red Cross public health nurses gave care to 334,194 persons and made 1,038,363 visits on behalf of the sick. In their school and pre-school work these nurses co-operated with doctors in examining 618,623 children. In 459 communities 638 Red Cross nurses carried on this essential work, and 1,825 graduate nurse instructors taught classes in home hygiene and care of the sick to 61,855 persons who passed examinations on the subject. The first reserve of the Red Cross nurses' reserve corps was swelled to 16,894 picked registered nurses ready to act in any emergency of peace or war, and the total Red Cross nurses' reserve corps numbered 43,138.

Volunteers served a total of 11,836,107 hours in such specialized work as producing 2,098,571 garments for the needy in the United States and various countries in Europe; 9,958,201 surgical dressings and 18,834 Christmas bags for U.S. soldiers, sailors and marines stationed overseas; 1,145,963 pages hand transcribed and duplicated in Braille for distribution among blind readers.

Through field directors stationed at army, navy, marine corps and coast guard stations and Red Cross chapters, help was given in 1939 to more than 53,000 enlisted men. Through

Red Cross workers in 3,545 chapters, 140,357 war-disabled veterans were helped and other Red Cross personnel dealt with the problems of 58,505 ex-service men and their families.

In 1939-40 Red Cross chapters aided 121,108 civilian families with social and financial guidance, and 125 nutritionists and food experts assisted 74 Red Cross chapters throughout the U.S. in passing along information on the value of health-protecting foods and adequate diets.

The American Red Cross offered relief aid to all belligerent nations following commencement of European hostilities in Sept. 1939. Subsequently, relief was given in England, France, Poland, Finland, Norway and Luxembourg. Belgian and Dutch refugees in France and England also were aided. China likewise received relief.

An army of volunteer women in Red Cross chapters in the U.S. produced 825,000 garments and 6,600,000 surgical dressings, shipped abroad prior to Sept. 1940. Thousands of tons of food, medicines, ambulances, hospital equipment and other relief essentials were purchased in the United States and shipped abroad. Cash funds were allocated to Red Cross societies in combat areas and to American Red Cross delegates in Europe to purchase supplies needed on an emergency basis.

As of Aug. 31, 1940, a total of \$5,809,204 had been spent on European war relief and an additional \$3,051,614 had been committed for expenditure, making a total of \$8,140,818. To finance these extensive operations, the Red Cross appealed to the U.S.

for a \$20,000,000 war relief fund, which was oversubscribed.

(G. S. Br.)

The original function of a national Red Cross society in war was to aid the sick and wounded of the armies. As military forces developed medical corps and the character of warfare changed, Red Cross activities became more diverse. Protection of civilian populations, extension of relief to the bombed-out and evacuated, service for prisoners of war and establishment of bureaus of information were added to the traditional wartime activities of rescue, treatment and rehabilitation of soldiers.

Great Britain.—In Great Britain the British Red Cross, formed in 1870, and the Order of St. John of Jerusalem which operates ambulance units, established a joint War Organization to conduct Red Cross activities. Under military control, the War Organization operated hospitals and convalescent homes, produced and maintained stores of medical supplies for the military services, organized detachments of men and women for the protection of civilians, operated an information bureau seeking news about wounded, missing, or prisoners of war and prepared and dispatched parcels for war prisoners in enemy territory. It was assisted by the other Red Cross societies of the British empire.

France.—The French Red Cross, organized in 1864, was until 1940 composed of three societies, *Société française de Secours aux Blessés Militaires*, *Association des dames françaises* and *Union des femmes de France*. From Sept. 1939, until June 1940, the society operated ambulance units, maintained auxiliary hospitals, recruited and trained personnel for military health service and organized air raid protection. After the armistice of June 1940, the three separate societies were disbanded and a single organization formed under the name of the "French Red Cross."

Germany.—In 1921 the Red Cross societies of the several German states were combined to form a federated German Red Cross. In 1937 it was reconstituted and placed under the direction of the reich minister of interior. The German government recognized it as a voluntary society serving as an auxiliary to the medical services of the armed forces. The German Red Cross enrolled and trained "sisters" (nurses) for service in military hospitals. It operated ambulance trains, maintained an information bureau on war prisoners, received, aided and directed refugees, sent parcels to prisoners in enemy hands, directed civilian relief in occupied territories and organized civilian air raid protection. Local committees functioned in the established military areas, conducting first aid programs, operating highway emergency stations and organizing men's and women's units for various duties.

Italy.—The Italian Red Cross, originally organized in 1864, was engaged primarily in health and protective medical work. It operated ambulance trains both at home and in the colonies, trained both volunteer and professional nurses and health officers, organized air raid protection and maintained first aid posts and motorized ambulance service. Its work in preventive medicine was continued under wartime conditions. Local committees sponsored anti-malaria and anti-tuberculosis efforts, maintained clinics and operated camps for children. In overseas work the Italian Red Cross operated ambulances and mobile surgery and X-ray units and assisted in public health work in such areas.

Refugees. The year 1940 brought no surcease to refugees in China and in Europe. In China the 30,000,000 refugees, uprooted since the beginning of the war with Japan, continued their trek in two great internal movements; one from the central and southeastern regions to the southwest, and the other from the northeast to the northwest. In Europe, to the 250,000 Spanish refugees in France and the 140,000 German, Austrian and Czech refugees in the western transit countries at the beginning of the year were added some 3,000,000 to 4,000,000 Poles and Polish Jews, put to flight eastward and southward by the German invasion of Poland. As a result of the Russian conquest in Finland 400,000 people had to be resettled within the narrow confines of the shrunken borders of their country. A similar movement of lesser proportions followed the German invasion of Norway in April.

QUANTITIES OF BLOOD PLASMA were shipped to Britain by the American Red Cross in 1940 for use in emergency operations

The terrifying advance of the German armies into the Low Countries in May drove 3,000,000 people from Luxembourg, Holland, Belgium and northern France into southern France, clogging the roads and impeding the operations of the allied armies. After the collapse of France the great majority of these returned in despair to their villages to pick up the threads of living again as conquered peoples.

The refugee migrations of 1940 exceeded in numbers and in stark tragedy all earlier migrations resulting from the World War of 1914-18, political revolutions and persecutions. They were quick and violent in action involving whole populations and were shocking to the sensibilities of the civilized world.

The war of 1914-18 had precipitated substantial movements of Turks, Greeks and Bulgarians. Under bi-lateral treaties and financing and direction by the League of Nations these had been controlled and orderly in comparison, and settlement had been facilitated because they consisted chiefly in exchanges of populations, the refugees returning to their native countries to resume their own cultures and citizenships.

The Russian and Armenian refugees had spread westward through Europe during the decade from 1920 to 1930 in a period of rising prosperity. In a sense they had set the patterns of refugee experience for the 400,000 refugees who were forced to leave Germany after the nazi revolution in 1933, Austria after the Anschluss of 1938, and Czechoslovakia after its absorption in 1939.

The Russian and Armenian refugees of the preceding decade had experienced the vicissitudes of statelessness and the inhospitality of governments which offered them uncertain civil status and meagre living from the most arduous employments. Even as late as 1938 the League of Nations reported almost 1,000,000 of these earlier refugees still unsettled and with no prospects of settlement. Their lot was made worse by the German advance into western Europe in 1940.

The refugees from central Europe burst upon a world in the throes of economic depression beset by unemployment and decidedly less hospitable. They were predominantly urban in character, intellectuals, professionals, merchants, bankers, technicians and artisans. Throughout the world there had been a drift of populations from rural to urban areas. The cities of the receiving countries in Europe and overseas feared the accretions to their populations which this tide of refugees would bring. Under these circumstances this dispersion of central European refugees could hardly have taken place in such numbers unless forced by the persecutions and terrors of the nazi government in Germany or by the advance of the German army into Poland.

GOING AND COMING in May 1940. British troops on their way to the battle front in Belgium pass refugees fleeing before the German advance

Switzerland, France, Holland and Belgium had accepted refugees in flight across their borders on humanitarian grounds, but in the confident hope that they might soon migrate again to settlements in overseas countries. Early in 1939, their absorptive capacities exhausted, they were forced to seal their borders hermetically. Thereafter there was forced dispersion of refugees overseas to Latin and South American countries and to the near east. Many ships loaded with hopeless refugees wandered for weeks and months in the eastern Mediterranean searching for a port at which to land. Illegal immigration became a difficult problem for the British government in Palestine.

By 1940 Palestine had absorbed over 250,000 Jewish refugees from Poland, Rumania and Germany. The United States accepted some 70,000 to 90,000 refugees from central Europe from 1933 to 1940, and South American states equal numbers.

The outbreak of war in Poland in Sept. 1939 and its spread to western Europe in the spring of 1940 interfered seriously with the flow of refugees from Europe during the year. Transportation facilities were greatly reduced and fears of potential "fifth columnists" among the refugees, after the conquests of Norway, the Low Countries and France, tended to close the doors of overseas countries to the greatly increased numbers of refugees struggling desperately to get out of Europe. After Italy entered the war and the Mediterranean became a scene of war operations Portugal became the only port of westward exit. Refugees in limited numbers from central Europe thereafter travelled across Siberia and the Pacific ocean to reach the western hemisphere.

The war in Poland drove over 100,000 Polish refugees into the Baltic countries, Rumania, Hungary and Yugoslavia. Polish Jews fled southward and eastward into soviet Poland, and later those who had found temporary refuge in the Baltic countries faced new pressures when soviet Russia absorbed Estonia, Latvia and Lithuania. During Nov. and Dec. 1940 reports of refugee trains dispatched daily to Siberia loaded with refugees from soviet Poland and the Baltic countries were persistent. Although no authoritative figures became available conservative estimates placed the numbers in Siberia at the end of the year at 300,000.

The German reorganization of Poland and the transfers of territories during the year in the Baltic and Balkan countries resulted in many cross movements of populations. Baltic Germans were

repatriated to the former area of Poland that was absorbed into the German reich. From this same area Poles and Jews were driven eastward. During the fall over 300,000 Germans were in process of repatriation from Bukovina, Bessarabia and Rumania to Germany. Earlier in the year some 200,000 Austrians had left their homes in the Italian Tyrol for new homes in Germany and Austria.

In the flight from Dunkirk in June some German, Austrian and Czech refugees and smaller numbers of Dutch and Belgians got to England with the retreating British army. England had previously given temporary refuge to 65,000 refugees from central Europe. In 1939 these refugees had been classified according to their loyalties and certain classes interned. After the collapse in Flanders all were interned regardless of classification. During the late summer many of these refugees were removed to Canada, Australia and New Zealand along with prisoners of war. When the bombing of England began, organized efforts to rescue British children were made simultaneously in Canada, the United States and Australia. Approximately 3,000 children were sent to Canada, equal numbers to the United States and some to Australia before the British government cancelled the schemes because of the dangers of losses of transports at sea.

The dual German effort to press the war to a conclusion and to establish the "new order" in Europe produced many minor movements of special groups such as Czech, Danish, Norwegian, Dutch and Belgian workers to the farms and war industries of the reich. Taken together these transfers subjected hundreds of thousands to forced labour beyond the borders of their own countries.

Following the incorporation of Luxembourg and Lorraine into provinces of the German reich, non-Aryan refugees were expelled from Luxembourg and 10,000 to 20,000 of the French population of Lorraine were moved into unoccupied France. The resistance of the French government probably prevented the transfer of larger numbers from Lorraine. In November over 10,000 Jews, mostly elderly people, were transported from Baden and the Palatinate to unoccupied France, greatly increasing the population of the concentration camps in this area. Refugees who managed to be released from these camps reported sordid conditions of overcrowding, inadequate sanitary provisions, lack of proper bedding, poor food and slight protection from the cold.

As 1940 closed there were approximately 100,000 refugees from central Europe and about 50,000 unabsorbed Spanish refugees

in unoccupied France desperately anxious to emigrate overseas. In November and December exit through Spain became increasingly difficult. In Lisbon and Oporto there were over 8,000 refugees, safe for the moment, but living in daily fear that Spain and Portugal might be invaded by Germany.

While hopes of emigration existed for some of the refugees in southwestern Europe, prospects of escape for the racial and political refugees locked in central and southwestern Europe dwindled. These were conservatively estimated to be 240,000 in Germany, 80,000 in Czechoslovakia, 1,250,000 in Hungary and Rumania, 1,500,000 in Poland and 30,000 to 40,000 in Italy.

International action on behalf of refugees was at a comparative standstill during the year. Relief activities were severely restricted by the blockade controls and opportunities for emigration were greatly reduced. The project to settle refugees in the Dominican Republic, started under the auspices of the Intergovernmental committee in 1939, proceeded encouragingly. The first 500 settlers were already establishing homes on the land in the Sosua area at the end of the year and preparations had been completed for the reception of 1,000 additional settlers already selected in Europe. A scientific survey was under way to determine the possibilities of cash export crops for the refugee settlement. Conclusive demonstration had already been made that central Europeans could do their own work in the open in the sub-tropical area of the Dominican Republic without detriment to health and that self maintenance was possible by the refugees.

Official bodies such as the League of Nations High Commissioner for Refugees, the Intergovernmental committee, and the International Labour office were unable to take effective action during the year because of the impediments to intergovernmental collaboration created by the war. While planned action toward the solution of refugee problems by official and private bodies proved difficult during the year, there was growing realization of the enormity of the problem to be faced when the war ended. Reichenau, Walter von (1884–), German soldier, often spoken of as "Hitler's favourite general." Born at Karlsruhe, he entered a field artillery unit in 1903 and was assigned to the general staff during the World War of 1914–18. After Hitler's assumption of power he became successively chief of staff of an army corps, general in command of an army corps and secretary of state to the minister of war. During the campaign of May–June 1940 he commanded the central group of armies and directed the drive which routed the Allied troops in Flanders. He was created field marshal by Adolf Hitler on July 19.

Relief. During 1940 two factors influenced policies governing relief in the English-speaking world: the European war and political pressure to liberalize public assistance. The war led each country to pass special legislation protecting enlisted men, persons engaged in the defence industries and, in England, civilians affected by evacuations, by radical changes in industry or by injuries suffered from the enemy. In Canada, dependents of enlisted men received allowances from the dominion treasury; their rights under unemployment insurance were protected by the same authority. In the U.S. no provisions were made in 1940

for enlisted personnel, although at the last session of congress in 1940 various proposals were submitted.

England adopted the widest special war coverage yet attempted. Evacuation of three-quarters of a million children, sometimes with their mothers, was effected from bomb-target cities and the cost of caring for them was borne by the national treasury. Civilian losses due to the war, such as injury or death in an air raid, destruction of property or of business were responsibilities taken over by the Unemployment Assistance board, renamed, because of its wider function, the Assistance board. It was financed by the national treasury. No reports seem to be available of the amounts spent, or the numbers benefited by the above two war services.

In the liberalization of relief, there was a tendency to associate relief with the insurance schemes. In the United States, the old age insurance plan was revised in the summer of 1939, and effective beginning with 1940, in order to write in as beneficiaries some whose equity in the fund would not entitle them to such benefits: persons reaching the age of 65 by 1940 and who had therefore not built up much of an equity in the fund, wives of the insured and survivors of insured workers. However, such violation of actuarial requirements in old age insurance was adopted avowedly in all European systems of old age insurance from their inception as the fair method to those whose age at the inauguration of the systems precluded them from securing any but a microscopic income on reaching 65.

Canada in 1940 set up a simple and logical system for care of the able-bodied unemployed. It established a national scheme, financed and administered by the dominion for their care either by insurance or by work relief or by relief alone. It turned back to the provinces complete responsibility for all other relief, whether it be care of the sick, the aged or children. The dominion government would, however, enter the field, wholly caring for any unusual agricultural distress, such as was caused by the drought in the wheat-raising provinces a few years before and share with the provinces any scheme for old age insurance.

In England the renamed Assistance board was given responsibility for supplying supplementary aid to the aged receiving an insufficient income from their old age insurance benefits, in addition to its care of the able-bodied unemployed who exhausted their insurance benefits and the war services. The Labour members of parliament urged the government to increase the benefits under old age insurance, but instead the government passed a provision that beneficiaries who could show need would be eligible for supplementary aid on a budgetary basis from the Assistance board.

While there were agitations in all countries under review for the establishment of flat old age pensions given irrespective of need, only New Zealand granting \$50 a month to all over 65 years of age adopted such a plan. The experiment was too new for a judgment on its practicability.

In the United States relief was set up in the same complicated pattern under which it had operated since 1935: the federal government furnishing work for some unemployed able-bodied persons, varying in 1940 from one and two-thirds million workers to two and a third million and costing from about \$95,000,000 to \$125,000,000 a month, but assuming no responsibility for the unemployed whom it did not or could not draw into its work projects. The federal government also paid half the cost of relief of the aged, the blind and of dependent children in their homes. It left all other need to the care, but more often to the neglect, of local authorities.

Taking a leaf out of Swedish experience with surplus agricultural produce in using it to feed the portion of the population less able to provide itself with adequate food, the federal gov-

ernment contributed to general relief after 1936 by buying up surplus food directly from farmers, under certain conditions, and then distributing it to persons on relief of almost any kind, to schools for lunches for children, to workers on WPA or those certified for it, to those receiving old age assistance, aid to the blind and to parents of dependent children and to those on agricultural relief. Late in 1939 an ingenious scheme known as the food stamp plan was suggested by retail and wholesale commission dealers as a substitute for this direct distribution and to replace these goods within the channels of trade. Each person or family certified as in need was given 50% additional allowance on his food budget in the form of stamps, which he might use to purchase certain designated articles of food at any food mart. This was still experimental and was being used only in a limited number of communities by the end of 1940. Surplus commodities elsewhere continued to be distributed directly as formerly.

The outstanding feature in administration of relief in the United States was the belated entrance of the merit system of personnel appointment wherever the federal government was involved in the field of assistance or insurance. Some states resisted and temporarily lost federal aid, others tried to postpone its adoption. But its practically universal adoption was a step toward placing the administration of the social services throughout the United States upon a plane of competency, freed from political influence. Religion. During 1940 students of the history of religion felt driven to contemplate the possibility of a reversal of its centuries of progress and of the serious institutional weakening of religion throughout the world for an indefinite time. Yet the report on "the state of the church" made to the biennial session of the Federal Council of the Churches of Christ in America declared that, in the upheavals of mankind, the church remains the least shaken of our major institutions. In a day of progressive loss of political and economic security, its own fellowship has held under all strains and its unity has increased. The World Council of Churches in process of formation reached a membership of 70 communions throughout the world and continued to gain adherents in all continents during 1940. One hundred and sixty-eight "orphaned missions" separated from their German, Belgian, Danish, Dutch and French support by the war were cared for by denominational missionary agencies co-operating through the International Missionary council. British churches both in England and South Africa safeguarded and aided the missions of nations with which they were at war. Communication was actively maintained among all branches of the church and extensive help extended to war prisoners and refugees. Almost complete loyalty to Christian fellowship continued among previously associated Christian leaders of the warring nations. Representatives of the oecumenical movement of the non-Roman churches conferred directly with the Pope concerning war work. In many parts of Europe Catholics and Protestants increasingly made common cause, and active interfaith co-operation in the United States and Canada was a strong influence against prejudice and in behalf of constructive national unity. The church, in brief, was in 1940 the most effective international agency which survived the stress of the times.

In contrast to easygoing views of religion cherished by 20th century liberalism, necessary conflict was stressed between the requirements of the absolute and eternal values and verities and moral life in a world in which no "good" choices are possible. A sense of tragic tension consequently came to characterize

religious experience, forced it to profounder levels, and was accepted as essential and normal in any truly realistic attitude toward existence.

A certain return to religion on the part of secular culture brought it notable recruits and allies in 1940. In line with a newly favourable concern with religion by literature, the Conference on Science, Philosophy and Religion, held at the Jewish Theological Seminary of America in New York in September, attempted to bridge the gap between science, philosophy and theology and to reinstate the fundamental realities of religion among the cultural values confessed by the contemporary mind.

Similar reinforcements to religion came from the world of practical affairs. A much discussed editorial in *Fortune* (Jan. 1940) called upon the church to save civilization by teaching "absolute spiritual values." This was symptomatic of a widening conviction in lay circles that only the interiorizing of moral authority through religious faith and discipline could check the disintegrating forces of the age. Indeed, so many recruits from secular fields flocked to the banner of religion that religious leaders began to inquire whether the unrealized motive might not be concern for the preservation of the social and economic *status quo*.

A new emphasis on religion was outstanding in the field of public education in the United States. From President Roosevelt and authorities of national educational associations down to state and city authorities, the role of religion in education was being newly emphasized. The same stress marked the writings of Christopher Dawson, Middleton Murry and T. S. Eliot in England. In the United States, legislation, which hitherto restrained religion in public education, was encouraging or requiring it in numerous instances. There was a rapid extension of local opportunity for religious weekday education on released school time.

As the political aspect of liberal culture, democracy itself was seeking the reinforcement of religion in its struggle against totalitarianism. Generally, the church declined to identify itself with the fortunes of any particular political system. At the same time, it had to recognize that all its objective values were actually wrapped up with particular human cultures. Religious opinion in the surviving democracies consequently largely came to pin its hopes upon their victory in the European war as the only outcome which could assure religion the basic conditions of normal existence. Within the democratic states themselves the church became newly sensitive to tendencies toward interference with religion; as evidenced, for example, in widespread Protestant opposition in the United States to the appointment of Myron C. Taylor as the President's representative to the Vatican, and in a widespread critical attitude toward American social security legislation as applied to religious workers, as a possible encroachment upon the prerogatives of the church.

The most crucial test of religion in the modern world obviously related to its attitude toward war. Almost universally the churches reiterated the conviction that war is sinful. They repudiated it as a method of adjusting human difficulties. But on every specific war measure, religious opinion divided. The conflict lay essentially between the pacifist attempt to practise absolute values, on the one hand; and, on the other, the sense of involvement of all values in the inevitable practical consequences of war. In Great Britain, Canada and the United States religious conviction enforced a marked difference in the procedures of governments toward conscientious objectors as compared with those during the war of 1914-18. A broader recognition of the rights of conscientious objectors to exemption from military service was accorded. At the same time the rank and file of religious sentiment in all nations fell in behind national policy, though more discriminatingly than ever before, and more critically of attempts to bring religion into unthinking partnership with supposed

national necessities.

As war covered an ever larger proportion of the earth's area and took unprecedentedly destructive forms, a decreasing demand for any immediate blueprint of conditions of peace and reconstruction was evident. But a seminar held in connection with the biennial session of the Federal Council of the Churches of Christ in America in December called for the early organization of a competent body, representative of all constructive human interests, to draft the outlines of a world order based on religious insight; and the demand for such a sketch was continuous in Christian publications in Great Britain throughout 1940 as well as from the very beginning of the war.

The conviction that religion possesses the basic principles of a permanent world order and the hope of building a new world on religious foundations thus remained fundamental for all who hold to the Hebraic-Christian tradition. (H. P. D.)

Republican Party. As the Republican party entered 1940, preparation for the presidential campaign was the principal objective of the national organization. John D. M. Hamilton remained at the helm of the Republican national committee, and Franklyn Waltman, a former newspaper man, continued as its director of publicity.

Through its research division, under the direction of Olin Glenn Saxon, professor of economics at Yale, the national committee prepared factual studies on current issues. These were made available to Republicans in congress and to party workers throughout the U.S.

When the 76th congress convened for its regular session on Jan. 3, 1940, the Republicans held 23 senate and 164 house seats. Senator Charles L. McNary of Oregon and Representative Joseph W. Martin, Jr., of Massachusetts, continued, respectively, as Republican senate and house leaders. Representative J. William Ditter of Pennsylvania served as chairman of the Republican

Congressional committee, and Senator John G. Townsend, Jr., of Delaware headed the Republican Senatorial committee.

As in 1939, Republicans in congress showed increased activity. On several occasions, they joined with independent Democrats to defeat or sidetrack important administration bills. With few exceptions, Republicans supported the president's proposals to strengthen the army and the navy, and a Republican representative, James W. Wadsworth of New York, was the co-author, with Senator Edward R. Burke, Democrat of Nebraska, of the selective service bill that passed congress on Sept. 14, 1940.

Republicans in both houses opposed almost solidly the administration's proposal to extend the Trade Agreements act for three years. House Republicans, by a majority of over 100, voted against the \$212,000,000 appropriation for parity payments to farmers and a majority of 100 Republican votes was also recorded against a \$50,000,000 increase in the appropriation for the Civilian Conservation corps. Though opposed by a majority of house Democrats, only one Republican vote was cast against the bill to extend to state and local government employees, paid in whole or part from federal funds, the prohibitions imposed by the 1940 Hatch act on political activities by federal officeholders. House Republicans voted, in a ratio of approximately six to one, for a 60-day trial of volunteering before resorting to conscription.

The Election.—On Feb. 16, 1940 under call of Chairman Hamilton, the Republican national committee met in Washington. The committee set June 24 as the date for the national convention and picked Philadelphia as the convention city.

In the early months of 1940, three Republicans appeared to hold a commanding lead in the race for the Republican presidential nomination. These three were Thomas E. Dewey of New York, Senator Arthur H. Vandenberg of Michigan and Senator Robert A. Taft of Ohio. As a result of his defeat by Mr. Dewey in the Wisconsin and Nebraska primaries in April, Senator Vandenberg lost ground and Mr. Dewey and Senator Taft entered the convention as the leading candidates.

Governor Harold E. Stassen of Minnesota delivered the keynote speech, as temporary chairman, at the opening of the Republican national convention at Philadelphia on June 24. Representative Joseph W. Martin, Jr., was the permanent chairman. Opposing participation in foreign wars, the Republican platform urged a stronger national defence, demanded a slash in federal expenditures and sharply criticized the concentration of power in the executive by the party in power.

"I STAND BEFORE YOU without a single pledge or promise . . ." said Wendell L. Willkie on June 28, 1940, to the Republican convention at Philadelphia which had chosen him as the party's presidential candidate early that morning

After both Mr. Dewey and Senator Taft had failed to secure the necessary majority, the convention, on the sixth ballot, nominated a "dark horse" candidate, Wendell L. Willkie, whose candidacy, in the months immediately preceding the convention had gained increasing strength among rank-and-file Republicans. Senator Charles L. McNary of Oregon was picked as his running mate. On July 7, Mr. Willkie appointed Representative Joseph W. Martin, Jr., as chairman of the Republican national committee, and on July 22, he announced the appointment of four anti-Roosevelt Democrats to organize a national independent movement in support of his candidacy. In his acceptance speech, on Aug. 17, he endorsed many of the New Deal's domestic measures. During the campaign, Mr. Willkie travelled widely, making scores of speeches.

In the Nov. 5 elections, Mr. Willkie received 22,333,717 votes as compared with 27,243,604 for Mr. Roosevelt, according to a compilation made by the Republican national committee. This was the largest popular vote ever given a Republican presidential nominee. Mr. Willkie, who won 82 electoral votes, carried ten states: Colorado, Indiana, Iowa, Kansas, Maine, Michigan, Nebraska, North Dakota, South Dakota and Vermont. Though the Republicans increased their strength in the senate by five, the Democrats gained in the house.

In a radio address on Nov. 11, Mr. Willkie urged that congress, because of the emergency arising from the European war, remain in session. Republicans in both houses opposed adjournment. As the year drew to a close, Republican leaders indicated that they would support the president's program for increased aid to Britain. (See also ELECTIONS; UNITED STATES.) (O. McK.)

Resins, Synthetic: see PLASTICS INDUSTRY.

Retail Sales. The sales for 1940 of all types of United States retail stores have shown an increase of approximately 8% over 1939. The department of commerce estimates that the total volume of business reached by all types of retail stores was \$45,500,000,000 for the year 1940.

The largest sales increases in dollar volume were shown by the two major combination retail-mail-order companies. The gain in 1940 sales over 1939 for Sears was 13.9% and the gain for Ward's was 8.8%. The volume increases in retail sales of regular department stores did not reach their percentage of increases, since the sales of the department store group were only 7% larger in 1940 than in 1939.

The larger increases in the sales volume of the retail-mail-order companies were due in part to their opening additional retail units and in part to an improvement in economic conditions in rural communities covered by their mail-order activities.

Estimated total dollar sales in 1940 were only 6% below the 1929 volume, the highest year on record. For department stores, the number of transactions increased about 3% in 1940 over 1939 and about 16% in 1940 over 1929, the peak year.

The increase in sales volume for department stores in 1940 over 1939 enabled them to make only a slight reduction in their operating expenses because the increased physical volume handled necessitated additional personnel and the average wage levels were increased. Consequently, the percent of total pay roll expense to total sales in 1940 was about the same as in 1939.

At the close of the 1940 fiscal year, retailers had their inventories in a satisfactory position. Although the inventories averaged about 11% more in dollar value than they were at the close of 1939, this was not out of line with the expected increases in sales that are looked for in the early months of 1941 since it is expected that these increases will average at least 7½% during the first quarter of 1941.

The increase in the dollar value of inventories was due in part to some moderate increases in wholesale prices and in part to retailers' extending their commitments for a longer period where this was advisable to ensure deliveries of the merchandise.

Retailers were showing a commendable attitude in co-operating with the government in exerting every effort to hold down wholesale prices and not to speculate against impending price rises by making advance commitments. Instalment sales, or sales on deferred payment, showed an increase of approximately 12% in 1940 over 1939 since retailers have extended this plan of buying merchandise to additional lines of consumer goods.

Net profits on sales of department stores in 1940 generally will show an increase over 1939 before taxes are deducted.

The control of operating expenses in 1941 will still be a major problem for retailers in view of the higher prevailing wage levels, the tendency to shorter hours and the prospect of additional taxes. (See also CHAIN STORES; MAIL-ORDER BUSINESS; MARKETING.) (P. J. R.)

Reynaud, Paul (1878—), French statesman, born at Barcelonnette, Basses-Alpes, Oct. 15. He was educated at a Paris lycée and received his doctorate in law from the University of Paris in 1904. He served throughout the World War of 1914-18 and received the Croix de Guerre. His political career began with his election in 1919 to the chamber of deputies from Basses-Alpes. He was minister of finance in the Tardieu cabinet (1930), minister of colonies in the Laval cabinet (1931-32), vice-president of the council and minister of justice in the Tardieu cabinet (1932) and minister of justice and minister of finance in the Daladier cabinet (1938-40). On March 21, 1940 he succeeded Daladier as premier. Less than two months later the German invasion began. On June 6 he reshuffled his cabinet and ousted Daladier as minister of foreign affairs. On June 10 he moved his government from Paris to Tours and on June 14 from Tours to Bordeaux. On June 16 he resigned and was succeeded by Pétain, whose lot it was to ask Germany for peace. Reynaud, along with other former officials, was taken into custody Sept. 7 to await trial at Riom on charges of contributing to the French defeat.

Reynolds, George McClelland (1865-1940), U.S. financier, was born in Panama, Ia., Jan. 15. He was educated in the public schools and at the age of 15 was employed by a bank in Panama. The Continental National bank of Chicago made him cashier in 1897 and in 1906 elected him as its president. Through various consolidations and mergers he built up the first billion dollar bank in the Middle West and the second largest in the U.S.A., under the name of the Continental Illinois National Bank and Trust company. He remained with it until 1933. In 1932 he was chairman of the National Credit corporation, formed to aid banks in distress before the creation of the Reconstruction Finance corporation. He died in Pasadena, Calif., Feb. 26.

Rheumatism: see ARTHRITIS.

Rhode Island, one of the original states of the United States, popularly known as "Little Rhody," is a north Atlantic state of the American union, belonging to the New England group; area, 1,248 sq.mi. (smallest of the United States); population according to the U.S. census of 1940 was 713,346. The

ethnic composition (1936 state census) was as follows: native white 77.2%, foreign-born white 21.3% (French Canadian 4.9%, Italian 4.4%, English 3.0%, Irish 2.0%, Polish 0.9%, Scotch 0.8%), Negro and other non-white 1.5%. The population increase between 1930 and 1940 was 25,849 or 3.8%, as compared with 13.7% between 1920 and 1930. The increase between 1930 and 1940 was the smallest in the state's history, excepting that during the period from 1790 to 1800 when the population was practically stationary. The population in 1940 represented a density of 674.2 per square mile of land area (1,058 sq.mi.).

The urban population in 1940 was 653,383 or 91.6%. The increase within urban areas from 1930 to 1940 was 2.8% as compared with 15.2% within the rural sections. This period showed a reverse in a trend toward greater concentration of population in urban areas, which lasted from 1830 to 1930.

The cities are Providence (capital), population (1940), 253,504; Pawtucket, 75,797; Woonsocket, 49,303; Cranston, 47,085; Newport, 30,532; Warwick, 28,757; Central Falls, 25,248.

History.—At the regular 1940 session of the legislature leading measures passed were: act granting a new charter to city of Providence; act giving Providence a fifth seat and Pawtucket a second seat in the state senate and revising senatorial and representative district lines in Providence; act providing for a referendum on a nonpartisan system of municipal elections in Providence; act modifying the requirement for mandatory certification of cases to the supreme court from lower courts on constitutional questions; act placing a top limit of \$3,000 on the amount of employee's salary on which an employer must pay unemployment compensation taxes; act establishing uniform aeronautics laws; act making appropriations for support of the state totalling \$15,180,983.27 for fiscal year 1940-41; act appropriating \$50,000 for use of the attorney-general's department in investigating election frauds; act granting \$6,950 to pay the legislative committee on elections, frauds and corrupt practices and its clerks; acts allowing Providence to issue \$1,000,000 in funding bonds and \$750,000 in bonds for school improvements; act requiring cities and towns asking authority from the state legislature to issue bonds to provide specific information on their financial condition.

The chief officers of the state were: William H. Vanderbilt, governor; James O. McManus, lieutenant-governor; J. Hector Paquin, secretary of state; Louis V. Jackvony, attorney-general; Thomas P. Hazard, general treasurer; Edmund W. Flynn, chief justice of the supreme court. Elected at the November elections to the chief executive offices for 1941-42 were: J. Howard McGrath, governor; Louis W. Cappelli, lieutenant governor; Armand H. Cote, secretary of state; John H. Nolan, attorney-general; Russell H. Handy, general treasurer. In the 1940 presidential elections Roosevelt (Dem.) received 181,122 votes; Willkie (Rep.) 138,214; Browder (Com.) 239; Babson (Prohib.) 74.

Education.—During 1939-40 there were in the public elementary schools 65,841 pupils and 2,246 teachers; in junior high schools 24,443 pupils and 972 teachers; in senior high schools (three years) 17,967 pupils and 801 teachers and in senior high schools (four years and vocational) 5,947 pupils and 210 teachers. There were in private and parochial elementary schools 23,149 pupils; in junior high schools 4,742 pupils; in senior high schools (three years) 463 pupils and in senior high schools (four years) 5,706 pupils. Teachers in private and parochial schools numbered 1,222. During the school year 1938-39 per capita costs based on average membership and day school current expenditures were \$95.30 for the state, ranging from \$130.24 to \$64.48 for the various towns and cities; per capita costs of public day schools for the state were \$78.93, \$101.70, \$136.22 and \$112.56 for elementary schools, junior high schools, senior high schools (three years)

and four year high schools, respectively.

Charities and Correction.—In Nov. 1940 the state department of social welfare administered aid to the following classes

J. HOWARD McGRATH, Democrat, was elected governor of Rhode Island Nov. 5, 1940

and numbers of relief recipients: old-age assistance, 6,968 persons; aid to dependent children, 1,263 families (3,572 children); aid to the blind, 68 persons; state unemployment relief, 5,168 cases; soldiers' relief, 198 cases. The total number of persons receiving relief in all categories (including a small amount of overlapping among categories) was 32,435 or about 4.5% of the state's population. Under the same department these institutions reported for November, inmates: mental hospital,

2,774; infirmary, 817; school for feeble-minded, 771; home and school, 221; correctional school for girls, 36; correctional school for boys, 100; soldiers' home, 72; reformatory for men, 82; reformatory for women, 23; jail and prison, 402.

The department also exercised guardianship over 1,378 child wards of the state.

Banking and Finance.—In the state there were 35 banking institutions. Resources of 23 banks under state supervision totalled \$455,978,639.75 and of 12 banks under federal supervision, \$125,514,639.22. Savings deposits in savings banks and trust companies amounted to \$319,022,873, representing 404,695 depositors June 30, 1940. In addition, six loan and investment companies had resources of \$9,139,878.47; eight building and loan associations, \$39,402,013.44; 18 credit unions, \$3,550,341.30.

Civil Service.—Of a total of 4,380 state employees, the number placed in classified service was 3,541, representing 525 distinct occupational classes. Starting off during 1940, under the new act requiring open competitive examinations for all positions, 76 examinations were completed and appointments made to 282 key positions. Also, at close of the year 18 examinations were in process covering approximately 550 additional positions.

Agriculture.—The farm population was 21,751 (1935). Land area in farms (1940), 221,913 ac.; 3,014 farms; value, \$26,334,374. Crop production estimate (1940), by acres and quantity indicated: tame hay, 46,000 ac., 56,000 tons; alfalfa, 1,000 ac., 2,000 tons; potatoes, 4,500 ac., 878,000 bu.; corn, 10,000 ac., 369,000 bu.; apples, 267,000 bu.; peaches, 18,000 bu.; pears, 7,000 bu.; grapes, 280 tons. Livestock, 3,000 horses and colts; 24,000 dairy cows and 6,000 other cattle; 7,000 hogs; 2,000 sheep and lambs; 370,000 hens; 36,000 turkeys. Livestock products (1939), 145,000,000 lb. of milk; 3,666,000 dozen of eggs.

Industry and Business.—Rhode Island Unemployment Compensation board reports for 1939 total employment of 193,010, receiving wages of \$235,678,585. Manufacturing employment, 122,881, receiving wages of \$145,298,750. Contract construction employment, 7,179; mining and quarrying, 225; insurance, real estate and finance, 5,502; service, 14,113; transportation, 4,929; communication, 2,174; trade, 31,815; utilities, 3,350. The United States census of manufacturers for 1939 listed 1,460 establishments employing 106,275 workers, producing goods valued at \$516,390,541 and paying in wages \$105,406,950. (M. C. M.)

Rhodesia.

The territory extending from the Transvaal border northward to the boundaries of the Belgian Congo and of Tanganyika Territory. It is bounded on the east by Portuguese East Africa, Nyasaland and the Tanganyika Territory, and on the west by Belgian Congo, Portuguese West Africa and Bechuanaland. Area 440,656 sq.mi.; comprises two territories of the British empire, viz., Southern Rhodesia and Northern Rhodesia. Southern Rhodesia is a self-governing member of the British commonwealth, but supervision over native rights is reserved to the imperial government. Northern Rhodesia remains a dependency of the crown. Certain essential statistics are given in the table below. (See also BRITISH EMPIRE.)

History.—*Southern Rhodesia.*—On Sept. 12, 1940 Southern Rhodesia celebrated the 50th anniversary of the beginning of British administration in the country. Having freely entered the war at Britain's side, it devoted all its energies to the common war effort. At the request of the United party ministry, enlarged to include two Labour members, the legislature voted the unprecedented sum of £5,300,000 for expenditure in 1940-41, of which £1,500,000 was earmarked for the war.

A war loan of £1,000,000 was also raised, and loan certificates issued and eagerly bought up.

Compulsory military service for Europeans between 18 and 55 was introduced in May; and the first two age-groups, covering the ages 18 to 40, had been called up by the end of June. A native unit, the Rhodesian African Rifles, was also raised by voluntary enlistment. A large number of Rhodesian troops were drafted to the theatres of war in Britain and the middle east in the course of the year. For air-fighting, Rhodesia undertook to contribute three squadrons to the royal air force. The first of these was sent to Kenya on the outbreak of war; the other two were established in Britain. A scheme, however, was adopted for training pilots from all parts of the empire in Rhodesia, similar to the greater empire scheme in Canada, but on a smaller scale. Work was begun on the training centres, of which there were to be seven, and aircraft and instructors were sent out from Britain. When the scheme is in full operation, 2,000 pilots will be trained each year.

Equally important was the economic contribution to the war. A government committee was appointed in July to examine and harness the country's resources for the manufacture of munitions and essential civil supplies.

Shipments of such vital materials as chrome ore, asbestos, tungsten and mica were dispatched to Britain. The British government also undertook to purchase the whole output of frozen meat and of gold, as well as large supplies of tobacco, maize and other foodstuffs.

Northern Rhodesia, a non-self-governing colony, is poorer in population and resources than her neighbour. Volunteer forces were raised, both European and African, and a detachment was sent by motor to Kenya. Public money was voted and private gifts made for war purposes; and the production of minerals needed in Britain—copper, lead, zinc, cobalt and vanadium—was speeded up.

(R. Co.)

Ribbentrop, Joachim von

(1893–), German statesman. The son of a former lieutenant colonel, descended from a family long connected with the German army, he was born April 30 at Wesel on the Rhine and was educated at the gymnasium at Metz. In 1910 he went to Canada as an independent merchant. At the outbreak of war in 1914 he returned to Germany, enlisted in a Hussar regiment, advanced to lieutenant colonel, and by the end of the war was attached to the war ministry. After the war he returned to private business as a wine merchant. He first became identified with the nazi party as a worker in 1930. At his home in Berlin-Dahlem were held the important meetings that preceded Hitler's appointment as chancellor of the reich, Jan. 30, 1933. In 1935 Ribbentrop was appointed ambassador-at-large, and from 1936 to 1938 he was ambassador to Great Britain. He became foreign minister Feb. 4, 1938 and played a prominent role in the diplomatic negotiations that preceded the war.

Ribbentrop was at Hitler's elbow during all the latter's more important conferences with representatives of other states in 1940. He was also charged with releasing the official German apologies for the invasions of the year and on April 27 exhibited what he declared to be incontrovertible evidence that Britain had planned the invasion of Norway. Among his other diplomatic duties of 1940 were the signing of the Axis-Japanese pact on Sept. 27 and the several pacts by which Hungary, Rumania and Slovakia adhered to the axis. On July 19 Hitler declared before the reichstag that "the name of von Ribbentrop as foreign minister will for all time be connected with the political rebirth of Germany."

Rice.

Production of rice in the United States in 1940 was estimated by the department of agriculture Dec. 1 as 52,754,000 bu. compared to 53,722,000 bu. in 1939 and a ten-year (1929-38) average of 44,254,000 bu. The 1940 yield was reduced by heavy storms in August in Louisiana and Texas. Table I shows the estimated production by states in 1940 and 1939.

Table I.—Rice Production by States, 1939 and 1940

State	1940 bu.	1939 bu.	State	1940 bu.	1939 bu.
Louisiana . . .	18,040,000	21,120,000	Arkansas . . .	9,741,000	8,430,000
Texas	16,005,000	15,172,000	California . . .	8,986,000	9,000,000

The 1940 rice crop in China was estimated at 2,440,000,000 bu.; that of 1939 at 2,600,000,000 bu., and the five-year (1933-37) average at 2,454,000,000 bu. Spain, 11,758,000 bu. in 1940 as against 6,124,000 bu. in 1939 and a five-year (1932-36) average of 14,161,000 bu. The 1940 rice crop of Japan, 574,000,000 bu., was the smallest since 1935 and resulted in an acute rice shortage, with the government taking over distribution and limiting the supplies to hotels and restaurants in a number of cities. The government also authorized a subsidy of \$2,747,000 in July to growers to encourage increased production, and riceless meals, days and weeks were advocated and ration cards put into effect in certain areas. Reduction in the supply of farm labour and of fertilizers contributed to the short crop of 1940 and also of 1939

when production was 627,000,000 bu. Japan imported more rice in 1940 than at any time in 15 years. The 1940 crop in Chosen was estimated at 196,000,000 bu., compared to 131,000,000 bu. in 1939. Preliminary 1940 estimates in the Philippine Islands were for a crop of 52,000,000 cavans of 97 lb. per cavan. Imports were

estimated at 400,000 to 500,000 bags. Rice exports from Burma for Jan. 1, 1940 to August were estimated at 2,037,293 tons compared

Table II.—U. S. Exports of Rice by Countries, 1939 and 1940

	1940 lb.	1939 lb.		1940 lb.	1939 lb.
Cuba	239,514,000	239,449,000	Germany	..	180,000
Canada	15,150,000	10,006,000	Other European countries.	12,067,000	5,909,000
United Kingdom	10,600,000	10,782,000	Shipments from U. S. to possessions	263,409,000	211,284,000
Sweden	7,416,000	2,982,000	Puerto Rico	81,150,000	78,531,000
Belgium	4,561,000	13,349,000	Hawaii	971,000	1,102,000
Greece	3,243,000	12,580,000	Alaska	563,000	1,382,000
Denmark	1,823,000	4,168,000	Virgin Islands		
Netherlands	1,564,000	9,464,000			
France	541,000	78,000			

with 2,550,142 tons in the same period in 1939. Table II shows rice exports from the United States for the years ending July 31 in 1940 and 1939 by countries of destination. (S. O. R.)

Richardson, James Otto (1878—), U.S. naval officer. He was born Sept. 18 at Paris, Tex. and was graduated from Annapolis in 1902. From 1924 to 1927 he was assistant chief of the naval bureau of ordnance and from 1928 to 1930 director of officer personnel. He was chief of staff for the commander-in-chief of the U.S. fleet in 1935-36, commander of destroyers in the scouting force in 1936-37, assistant to the chief of naval operations in 1937-38, chief of the navy's bureau of navigation in 1938-39 and commander of the fleet's battle force from 1939 until his appointment on Jan. 6, 1940 as commander-in-chief of the United States fleet. After his return from Hawaii in July he conferred at length with President Roosevelt on the navy's war games in the Pacific. In October he held a series of conferences with Secretary of Navy Knox, President Roosevelt and naval officials.

On Jan. 8, 1941 President Roosevelt announced that Richardson would be succeeded Feb. 1 as commander-in-chief of the fleet by Rear Admiral Husband E. Kimmel.

Riesman, David (1867-1940), U.S. specialist in internal medicine, was born in Saxe-Weimar, Germany, March 25. He went to the United States in his youth and after studying in the high school at Portsmouth, Ohio, he entered the medical school of the University of Pennsylvania, where he graduated in 1892. He taught pathology for eight years and became a full professor in the medical school in 1912. He served in the army medical corps during the World War of 1914-18. He was co-editor of *History of Medicine in the Middle Ages*, *The American Textbook of Pathology* and several other books. He was interested in the Italian Renaissance and was made a chevalier of the Order of the Crown of Italy, but returned the decoration as a protest against fascism. He served as president of the American Society of Medical History and several other medical organizations. At the time of his death in Philadelphia, June 3, he was engaged in arranging for the erection of a laboratory at the Philadelphia General hospital in memory of Dr. William Osler.

Rivers and Harbours. Improvements of rivers, harbours, and other waterways of the United States for navigation are prosecuted by the corps of engineers, U.S. army, under the direction of the secretary of war and the supervision of the chief of engineers, in accordance with plans authorized by the congress. Approximately 1,000 river and harbour projects were in force on June 30, 1940. New work was completed on 89 projects and materially advanced on 221 other projects. Active maintenance operations were under way at 307 localities. Total expenditures during the fiscal year were \$113,700,000, of which \$70,700,000 was for new work. The total net

water-borne commerce during 1939 over federally improved waterways and harbours of the United States, after eliminating all known duplications, was 569,400,000 short tons.

The principal items of new work in progress during 1940 on rivers and harbours, exclusive of that on canals and inland waterways, included rock removal and dredging in New York and New Jersey channels to secure increased depth of 37 ft. in rock and 35 ft. in other material to provide more adequate navigation facilities in this intensively used waterway which extends through Lower New York bay, Raritan bay, Arthur Kill and Kill van Kull to deep water in Upper New York bay; dredging to deepen the Delaware river channel from Philadelphia to the sea to 40 ft.; dredging in Thames river, Conn., to provide a 25-ft. channel to Norwich; breakwater construction and dredging at Stamford harbour, Conn.; the deepening of James river, Va., to provide a depth of 18 ft. at Richmond; and channel improvement to provide 6-ft. navigation from the mouth of West Pearl river to Bogalusa, La.

Additional dikes for contraction works and dredging for channel correction were under way at southwest pass, Mississippi river mouth, together with further improvement of Calcasieu river and pass, La., Sabine-Neches waterway, Tex., Houston ship canal, Tex., and Port Aransas-Corpus Christi waterway, Tex. On the Great Lakes work was advanced at Sturgeon bay and Lake Michigan ship canal, Wis., Keewanee waterway, Mich., Erie harbour, Pa. and Buffalo harbour, N.Y. Dredging was continued at San Diego harbour, Calif., to provide the 36- and 26-ft. anchorages in Area M; and in San Joaquin river to provide the 30-ft. channel to Stockton. On the Columbia river, Vancouver to Bonneville, 32 dikes were completed and dredging was executed for the 27-ft. channel. Major works completed include a 40-ft. channel at Boston harbour; jetty construction and dredging at Barnegat City, N.J.; a turning basin of 35-ft. depth at Hollywood harbour, Fla.; contraction works and a channel, generally 30 ft. deep, at south pass, mouth of the Mississippi river; channel facilities at Brazos island harbour, Tex., including a channel 28 ft. deep to Point Isabel and Brownsville; harbour enlargement at Fairport and Ashtabula, O.; and an 18-ft. channel with protecting entrance jetties at Yaquina bay and harbour, Ore. (See also CANALS AND INLAND WATERWAYS; FLOODS AND FLOOD CONTROL; WATER POWER.) (J. L. S.)

Europe.—There is something almost ironical, and even fantastic, in discussing dock and harbour developments in Europe under the conditions existing in 1940. Not only was there a paralysis of all engineering enterprise in the direction of port extension and enlargement, but the most intensive military efforts were devoted to the demolition and destruction, by gunfire, and explosive and incendiary bombs, of the installations hitherto in existence. Along the entire coast of northwestern Europe, from the north of Norway to the south of France, there was a sorry scene of ruin and devastation: the quays of Hamburg, Bremen, Rotterdam, Dunkirk, Calais, Boulogne, Cherbourg and Bordeaux, to mention only a few of the many instances, once busy centres of maritime trade, were completely in ruins or deserted by mercantile shipping, while the transit sheds and warehouses, which customarily store valuable produce, were either burned down or blasted beyond possibility of service. Spain was the only western country on the continent where there remained a semblance of constructional operations and, in this case, it was merely a program of restoration following an experience similar to that undergone by her neighbours.

Great Britain did not escape her share of the general devastation, the port of London being a conspicuous example. Apart from this, all improvement schemes were necessarily suspended for the duration of the war, except in a few cases where works begun some

RADIO-CONTROLLED FLOATING LIGHTS perfected in 1940 are used to convert rivers, harbours and lakes into sea-dromes

time ago, as at London itself, Avonmouth and on the Tyne, had reached an advanced stage, so that it was considered desirable to continue them to completion. But progress was slow, on account of lack of materials and labour which were diverted to military defence measures.

In Rumania, a new harbour, the foundation stone for which was laid by King Carol in Aug. 1939, was in course of construction at the port of Tashaul in the Black sea. Though designed chiefly for naval purposes as Rumania's chief naval base, it would also be used for commercial shipping to relieve the pressure at Constanța. It was to have an area of 2,594 hectares (about 6,000 acres).

Africa.—In Egypt, a scheme, estimated to cost £3,000,000, for the improvement and enlargement of Alexandria harbour was laid before the chamber of deputies by the Egyptian minister of communications. The main items in the scheme were the deepening of the principal entrance to the harbour to a depth of 42 ft., the construction of a new petroleum basin and of new quayage, together with the building of a dry dock for large vessels. The work, the inception of which was delayed by the war, would be spread over a period of from five to ten years.

A new port was in course of formation at Nacala, in Portuguese East Africa, where there is a natural harbour with deep water anchorage. Surveys had been completed and piling operations

were in progress. A railway was to be laid from Nacala to connect with the Mozambique-Nyasaland line. There was also steady progress at the port of Beira, where a new channel entrance to the port was being dredged to a width of 600 ft. and a depth of 18 ft. at L.W.O.S.T.

The important program of works for the enlargement of the harbour at Cape Town was pursued according to schedule. The new outer breakwater with a length of 7,000 ft. was completed and the new quay wall, designed to extend for a distance of 4,000 ft. from the south arm, was constructed for well over half its length. As the work progressed into deeper water, the rate of progress was necessarily slower. More than a moiety of the land reclamation in Table bay was effected, inclusive of the site for the new graving dock, 1,200 ft. long and 150 ft. wide.

At Durban, an important quay development scheme was in hand on the east side of the bay, comprising a T-shaped jetty with berthage adjacent for seven large ships and two other deep-water berths to the northwest. At the entrance of the harbour the cant of the north pier or breakwater was being removed to facilitate the movements of shipping.

Australia.—In Australia, a large new dry dock of outstanding dimensions (1,050 ft. long by 137 ft. wide at coping level with 45 ft. depth of water over sill) estimated to cost £3,000,000 was contemplated at the port of Sydney, New South Wales, and a site for the dock was fixed. (B. Cu.)

Roads and Highways. Highways and highway transportation continued to be of importance in every country of the world in 1940. Those countries at peace spent large sums in modernizing existing highways and in extending highway systems. The notable progress of the past few years in extending highways through sparsely settled regions and into less known portions of the world was continued. In those countries drawn into the European conflict major highway improvement was almost entirely stopped. Censorship in the countries at war prevented disclosure of complete information on highway improvement and use. However, there was much evidence of the importance of highway transport to a nation at war and of adaptation of road maintenance and vehicle movement to war conditions.

Highways of the world, in 1940 totalled 9,800,000 mi., of which about one-third had been improved. The use to which they were put is indicated by the 45,422,000 motor vehicles in use on Jan. 1, 1940. There is one vehicle to every 47 people. The United States led with 31,009,000 vehicles, followed by the United Kingdom with 2,430,000, France with 2,398,000 and Germany with 1,959,000. Next in order came Canada, Australia, Soviet Union, Italy and Union of South Africa.

United States.—Of the 3,000,000 mi. of rural road in the United States, 1,300,000 in 1940 were surfaced. The greater portion of highway expenditures went into the modernization of roads built some years ago rather than for the construction of entirely new roads. The highway event attracting the widest public attention in 1940 was the completion and opening to traffic of the Pennsylvania turnpike. This 4-lane divided highway, 160 mi. in length, extends from near Harrisburg to the suburbs of Pittsburgh, Pennsylvania. It is operated as a toll road. Features of the highway that contrast noticeably with most other highways, are the separation of grades at all intersections with other highways, the continuous wide right-of-way permitting control of roadside development, the complete control over all access to the highway thus removing the hazards of minor entrances, the absence of utility poles and all other features not pertinent to the operation of the highway.

In almost every state notable highway projects were completed or under way. Examples were the extension of the Blue Ridge

parkway in Virginia and North Carolina, completion of the bridge across the Mississippi river at Baton Rouge, La., work on the Arroyo-Seco parkway between Los Angeles and Pasadena, and reconstruction of sections of the Bear Mountain highway in New York and the Pacific highway in Oregon and Washington. During the fiscal year ending June 30, 1940, federal-state co-operative highway construction resulted in the completion of 11,397 mi. In addition, 414 railroad-highway grade crossings were eliminated at a total cost of \$296,932,000, of which \$179,952,000 was federal funds.

On Nov. 7 the 2,800-ft. highway suspension span over Tacoma Narrows, near Tacoma, Washington, the third longest span ever built, was wrecked by a high wind. Failure occurred four months after the bridge was put in service. Careful studies to determine the exact cause were not completed at the close of 1940.

The Proposed Highway to Alaska.—The commission appointed by the president to investigate the feasibility of a highway to Alaska and to consult with Canadian officials made a report during the year. It found that the construction of a highway was feasible, that the building of 183 to 275 mi. in Alaska and 1,000 mi. in Canada would provide a route. Extension of the life of the commission, establishment of an office for the commission and surveys of alternate routes are recommended. No agreement with Canadian officials was reached by the end of 1940 and funds for surveys and construction were not authorized.

Proposed Pan-American Highway.—Three-fourths of the South American section of the proposed Pan-American highway was, in 1940, passable during all seasons. The 8,097 mi. of highway between the Colombia-Panama border and Buenos Aires, Argentina (alternate routes included) had improvements as follows: Paved, 2,015 mi. or 25%; all-weather surfaces, 4,147 mi. or 51%; dry weather surfaces, 1,646 mi. or 20% and trails, 289 mi. or 4%.

Progress was made on the section of the route between the United States and Panama. This section is 3,260 mi. in length and is improved as follows: Paved, 1,180 mi.; all-weather, 767 mi.; dry weather, 492 mi. and trails, 821 mi. Tourists from the United States in 1940 could travel a considerable distance south of Mexico City but it was not possible to reach the southern border of Mexico. Loans made by the United States to Costa Rica, Panama and Nicaragua totalling \$8,800,000 will accelerate work on the highway during 1941. Steps were being taken to improve one of the most difficult sections on the entire route. The section is in southern Costa Rica through an almost uninhabited and little explored region of mountains and tropical jungle. Another difficult section, 300 mi. in length is between the Canal Zone and the Panama-Colombia boundary. Little progress was made toward a highway through this almost unexplored region of the Darien Indians.

Canada.—Much of the highway construction in Canada in 1940 was to serve the army camps and training areas of the air force. However, the war effort did not stop the expansion of the highway system that is so rapidly developing the country and attracting great numbers of tourists from the United States. The province of Quebec was embarking on a \$60,000,000, 3-yr. highway program. The Trans-Canada highway from Halifax to Vancouver, linking nine provinces, was open to travel except for a 190-mi. gap in the region north of Lake Michigan. On this route 1,981 mi. were, in 1940, surfaced and 1,839 mi. were unsurfaced. Construction opened to the tourist 186 mi. of breathtaking beauty on the highway connecting Banff and Jasper National parks in the Canadian Rockies.

Europe.—At the beginning of the war, major highway improvements were being made or planned in almost every European country. Rigid censorship prevented disclosure of the details of what has been done since war began but there was strong evidence that highway work has been limited to immediate military needs. German authorities reported 2,100 mi. of the system of *Reichsautobahnen* completed on June 1, 1940, an increase of 200 mi. in the preceding 12 months. At the same time 1,300 mi. were reported under construction.

In England substantial grants were made by the ministry of transport to local authorities for improvement of trunk roads.

Experience in the countries at war and earlier experience in Spain indicated that heavy bombing attack may cause temporary difficulties in highway service but that it does not put highways out of use for any length of time. In the London area efficient organization of crews that repair gas, water, electric lines and highway surfaces made possible the operation of the great system of bus transportation without serious difficulty.

Wartime use of highways in England was characterized by rationing of gasoline, use of producer gas as a substitute for gasoline, immobilization of vehicles when not attended and removal of all road direction signs. Instructions were issued regarding stopping at raid shelters, what to do in the case of gas attack, and traffic movement in event of invasion.

Practically no highway work was done in France in 1940. Spain began the repair of highways damaged during its civil war. Greece reported 250 mi. of highway built in the year 1940. Italy resurfaced 900 mi. of road in Albania and completed 2,000 mi. of the road system in Ethiopia. One of the *autostrade* or special toll roads built in Italy was absorbed by the state because it was not self-supporting as a toll road. This was the third of the *autostrade* to be taken over. Four remained in private ownership. It is reported that one of these will be transferred to government administration. In Finland 2,000 men were at work building a highway to Petsamo which was being developed as a port. A projected railroad to this port was abandoned. Sweden continued the work of extending low- and medium-type highways to all parts of the country. It had in 1940 about 55,000 mi. of surfaced highway of which about 32,000 mi. were dustless surfaces. Toward the close of 1940 Sweden found it impossible to import bituminous materials or continuation of the work. The soviet union continued the building of

THE \$70,000,000 four-lane Pennsylvania turnpike was opened to traffic Oct. 1, 1940. The maximum grade of this 160-mi. superhighway through the Appalachians is 3%; there are no crossings, and cars can take all curves at 90 m.p.h.

low-type roads but did not report any extensive program.

Africa.—South Africa made good progress on the 5,000-mi. national system which was enlarged and extended. Highways now penetrate almost all parts of Africa. In 1939, 3,600 mi. were built in the Belgian Congo bringing the total to 4,700 mi. An English company operated fleets of buses in Kenya, Uganda and Mombasa in 1940. A 62,000-mi. road system extended across French possessions in Africa and 5,500 mi. of bus lines were in operation. Three main routes connected points that were much in the war news, Agadir, Casablanca, Oran, Dakar and Tunis.

Australia and New Zealand.—Normal road programs were continued. In Sept. 1940 work was begun on a 450-mi. highway in central Australia to link the terminus of the Central Australian railway with that of the North Australia railway and make possible north-and-south transcontinental communication. This work was projected as a defence measure to give access to Port Darwin which hitherto has been isolated during the rainy season. Working day and night with the most modern road machinery the road was completed late in November.

Asia.—The condition of highway improvement in Japan and recent progress were not disclosed by the Japanese government. In that portion of China occupied by Japanese forces there was deterioration of existing roads and practically no improvements were made.

Road building in west China in the past few years, to provide a network of communication links with the outside world, stood out as one of the greatest road-building efforts of modern times. More than 20 national trunk lines totalling 9,000 mi. and traversing Chinese controlled territory were open to traffic in 1940. Highways of all kinds in the area totalled nearly 50,000 mi. and 6,800 mi. were under construction.

No highway was in the world news in 1940 more than the Burma road extending from Lashio near the Burma border across Yunnan province and on to Chungking, the wartime national capital and centre of the Chinese network of highways. The 610-mi. Yunnan section was completed in 1939 and by March 1940 goods valued at \$7,500,000 had been moved over it. It became a Chinese life line when all communication with the coast of China was stopped. British authorities stopped the movement of goods from Rangoon to the Burma road for a 3-months period beginning in July 1940.

After the reopening in October, large quantities of materials for Chinese armies were moved over it. Bombing attacks by the Japanese caused little damage. A hole blasted in the road could be repaired in a few hours and the larger bridges were not subjected to severe attack because of their remote location. Maintenance and repair of a large fleet of trucks operating over a great distance were more of a problem but this difficulty was being overcome.

The only contact of the Chinese with the outside world, other than over the Burma road, was through the "backdoor" overland route to the soviet union. Although twice the length of the Burma route, this road was much used for transport of military supplies. In Aug. 1940, while the Burma route was closed, the Chinese government placed 1,000 trucks in operation on a 700-mi. section of the route. Much work was done on this road in 1940. Winter snows, sometimes beginning in August, and distance from gasoline supplies are the greatest obstacles to transport over this highway. (See also TOWN AND CITY PLANNING.)

(T. H. MacD.)

Robinson-Patman Act: see CHAIN STORES; LAW (CASE).

Rockefeller Foundation was chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its program is concerned with certain definite problems in the medical, natural, and social sciences, the humanities, and public health. In the field of medicine its interest is centred in nervous and mental diseases, and its contributions are chiefly for the furtherance of research and teaching in psychiatry and allied subjects. Its program in the natural sciences is concerned with experimental biology. In the social sciences it has three spheres of special interest: international relations, social security, and public administration. The program in the humanities centres around the techniques by which cultural levels of contemporary society are being influenced—such as museums, the radio, drama, and libraries—and the promotion of better international understanding through cultural interchanges. The program in public health includes research on a number of selected diseases; demonstrations in the control of some of these diseases in their environments; co-operation with governments in services of central or

local health departments; and the development of public health education. During 1940 the Foundation appropriated approximately \$9,800,000 for work in its various fields of interest. The chairman of the board of trustees was in 1940 Walter W. Stewart; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

General Education Board was incorporated by an act of congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its program is restricted largely to the support of three types of work: (1) education in the southern states; (2) research and experimentation in relation to the problems presented in the field of general education; i.e., the secondary school through the junior college level; (3) a program in child growth and development. In 1941 the board will terminate its work in the fields of general education and child growth and development. During 1940 appropriations approximating \$6,500,000 were made by the board. The chairman of the board of trustees was in 1940 Ernest M. Hopkins; the president, Raymond B. Fosdick; and the secretary, William W. Brierley. (H. B. V. W.)

Rodman, Hugh (1859–1940), U.S. admiral, was born in Frankfort, Ky., Jan. 6, and was graduated from the United States Naval academy in 1880. He was promoted through various grades to rear admiral on May 23, 1917 and admiral on July 1, 1919. In the Spanish-American War he served on the "Raleigh," which fired the first shot in the battle of Manila bay. He was superintendent of transportation during the construction of the Panama canal in 1914–15 and served on the general board of the navy department in 1916–17. When the United States entered the World War in 1917 he went to sea as commander of a division of the Atlantic fleet. In April 1918 he was put in command of the entire U.S. battleship force in European waters. He retired on reaching the age limit in 1923, after receiving from the U.S. government the Distinguished Service and the Dewey medals. Great Britain made him a Knight Commander of the Order of the Bath, France made him a Commander of the Legion of Honour, Japan conferred on him the Order of the Rising Sun and Belgium gave him the Grand Cordon of Leopold II; he also received decorations from Peru and Chile. He represented the U.S. navy at the coronation of King George VI in 1937 and headed the line of foreign warships at the coronation review at Portsmouth. He died in Washington, June 7.

Rogers, Norman McLeod (1894–1940), Canadian statesman, was born in Amherst, Nova Scotia, July 25. He was educated at Acadia and Oxford universities, holding a Rhodes scholarship at Oxford. He served in the World War of 1914–18 with the Canadian Mounted Rifles. While acting as professor of history in Acadia university, he studied law and was admitted to the bar in 1924. He was professor of political science in Queens university from 1929 to 1935, when he was made minister of labour. When the cabinet was rearranged at the outbreak of the European war in 1939, he was made minister of national defence. He was killed in an aeroplane accident near Newtonville, Ont., June 10.

Roman Catholic Church. Though the residence of the pope and the offices of the Sacred Congregations, located in Vatican City state, are completely surrounded by Italian territory, Pope Pius XII maintained an absolute neutrality between the nations at war, continued to plead with all of them for peace and expressed concern for his spiritual children engaged in both sides in the conflict. However, the pope and cardinals directing the spiritual and material wel-

fare of the church maintained contact with the Vatican diplomatic representatives and delegates throughout the world and thus transacted normal, routine procedure.

Population.—An exact total of the number of Catholics in the world cannot be specified, but the latest available figures indicate that there are nearly 400,000,000. The largest percentage is found in continental Europe, the smallest in the missionary continents of Asia and Africa. In the English-speaking lands, the distribution is calculated as follows: the United States and territories, 21,403,136; Canada, 4,700,000; England and Wales, 2,410,000; Scotland, 615,000; Eire, 3,020,000; Australia and New Zealand, 1,693,725. In the Latin-American countries of Central and South America, the number is estimated at about 61,000,000.

Organization.—Full and plenary power over the spiritual welfare of all Catholics, wherever resident, resides in the pope, as the vicar of Christ on earth. Direction of the temporal welfare of the church, likewise, in all its phases, is held by him, solely. Closely associated with the pope, are the members of the College of Cardinals. The traditional number is 70; at the end of 1940, there were 55, since no vacancies were filled since 1938. Assisting him in the governance of the Universal Church are sacred congregations, with offices in the Vatican City state. By his appointment, and in conjunction with him, the bishops govern, in spiritual and temporal matters affecting the church, the dioceses assigned to them throughout the world.

In the Universal Church there were in 1940, 1,716 active ecclesiastical jurisdictions. These were classified as: patriarchates, 14; archbishoprics, 258; bishoprics, 940; apostolic vicariates, 306; apostolic prefectures, 128; abbacies and prelatures, 52; mission prelacies, 18. To these may be added 772 titular archbishoprics and bishoprics, that is, sees no longer having resident prelates.

In the United States there were, in 1940, 117 jurisdictions, governing which or connected with which there were 2 cardinal archbishops, 20 archbishops, 95 bishops and other prelates. The number of priests in the United States, including diocesan and religious, totalled 33,912. Parishes numbered 18,733.

England and Wales are divided into 4 archdioceses and 14 dioceses. Scotland has 2 archdioceses and 4 dioceses. Ireland is composed of 4 archdioceses and 25 dioceses. In Canada, there are 12 archdioceses and 36 dioceses and vicariates.

Roman Curia.—The government of the world-wide organization of the church reposes, under the pope, in the cardinals resident in Vatican City state. Ecclesiastical matters of a legislative and executive nature are handled by 12 sacred congregations, each of which is presided over by a cardinal. Matters of a judicial nature are decided by three tribunals, each, likewise, with cardinals as judges. Ordinary and extraordinary business of a spiritual and temporal nature is transacted by five so-called offices. The secretary of state, Cardinal Luigi Maglione, includes among his other functions the direction of Vatican foreign relations. The decisions of the congregations and tribunals and all Vatican documents are published in the official organ, *Acta Apostolicae Sedis*.

Among the acts of the congregation, the following are of popular interest. A new edition of the *Index of Prohibited Books* was issued. Placed on the Index during 1940 were all of the works (Italian) of Alfredo Oriani; Edmund Fleg, *L'enfant prophète Jésus*; Karl Pelz, *Der Christ als Christus*. The Sacred Roman Rota, marriage tribunal, heard 56 applications for a decree of nullity, forwarded from all parts of the world. Thirty-nine applications were rejected; 14 were granted and the marriage declared null; two dispensations were granted of marriage contracted but not consummated; one was held void because of procedure. Eugenic sterilization, either permanent or temporary,

was forbidden. Killing by the state of mental or physical defectives, because they were a burden to the state or society, was condemned. Use of electric light or oils, other than olive oil or beeswax, was permitted for sanctuary lamps in times of emergency. Due to the war conditions, Mass was allowed to be said on the afternoon of Christmas Eve, and modifications were made as to the Eucharistic fast.

On May 2, Pope Pius XII formally canonized St. Mary Pelle-tier (1796-1868), foundress of the Sisters of the Good Shepherd, and St. Gemma Galgani (1878-1903), tertiary of the Passionist order. On May 12, Mother Rose Philippine Duchesne (1769-1852), buried in St. Louis, Mo., who introduced the Society of the Sacred Heart in the United States, was solemnly beatified. Other beatifications included Joachima de Vedruna de Mas (1783-1854), foundress of the Carmelites of Charity; Marie di Rosa (1813-1855), foundress of the Servants of Charity; Emilie de Rodat (1787-1852), foundress of the Sisters of the Holy Family; and Ignazio da Laconi (1701-1781), Capuchin friar. A decree for the introduction of the cause for beatification of Elizabeth Ann Seton (1774-1821), famous American foundress of the Sisters of Charity, was ratified.

The Church in the Nations.—The status of the Catholic Church in all Europe was most depressed. In Italy, the confidence of the people in the pope, as a spiritual leader, remained firm. Some anti-clerical and anti-papal attacks were made by extreme fascists. In Germany and former Austria, the concordat of 1933 was violated more flagrantly in 1940 than in previous years. Subtle suppression of the church, in innumerable ways, was the constant principle of the nazis, and the youth were persistently nazified. The direct threat, during 1940, was that of securing allegiance through all means, mostly evil, of young clerics to the nazi system. Two reports were declared false: that the German and Austrian bishops, after their meeting at Fulda, would eventually issue a pastoral favourable to the nazis; that diplomatic agreements were being reached between Germany and the Holy See.

In the countries occupied by Germany, the church suffered a kind of martyrdom. Broadcasting over the Vatican radio in Jan. 1940, and confirming his utterances later, Cardinal Augustus Hlond, primate of Poland, declared that Poland was enduring a "wave of unparalleled atrocities and cruelties." The paganization was systematically carried through by both the German and the soviet despoilers. Belgium, predominantly Catholic, Holland, about 50% Catholic, and Luxembourg, nearly 90% Catholic, suffered in church property and through nazi anti-religious propaganda. On May 11, Pope Pius pledged the moral support of the Holy See to those countries, condoling with their rulers on the nazi invasion. A speaker over the Vatican radio station declared that Catholics in Alsace-Lorraine, comprising three-fourths of the population, "are being tried in the fire of a cruel persecution." Adverse conditions were rapidly developing in the Balkans toward the end of 1940 through the spread of war. Catholic progress in Norway and Finland was effectually stopped through the restrictions put on missionaries. Catholics in Lithuania, Latvia and Estonia, which had exchanged diplomatic representatives with the Holy See, were subjected to a campaign of the "godless" after the soviet conquest.

France, divided by the nazis, strove to maintain its normal religious life. Of some 15,000 priests mobilized in the French army as soldiers and officers, many were killed and others taken prisoner. The Vichy government, Sept. 3, repealed the anti-clerical laws of 1904. In Spain, the government renewed its allegiance to the Holy See. A building program included the restoration of 4,850 churches. A papal encyclical was addressed to Portugal on its eighth centenary as a nation. A concordat with

the Holy See was concluded on May 7, 1940. In England and the British commonwealth, in Ireland, in Switzerland, in Mexico and South America, as in the United States, the condition of the Catholic Church was normal and generally marked with progress. Though deprived of support from European sources, the far-flung missionary efforts of the church in China, Japan, India, the Pacific, Asia and Africa were blessed with fruitful results and brought an increasing number of converts. (See PIUS XII; VATICAN CITY STATE.) (F. X. T.)

Roosevelt, Franklin Delano (1882–). (See *Encyclopædia Britannica*, vol. 19, p. 535, for an extended biography.)

On Jan. 3, 1940, in his annual message to congress, President Roosevelt emphasized the need for stronger national defence and urged the extension of the Trade Agreements act. Said the president, "The overwhelming majority of our fellow citizens do not abandon in the slightest their hope and expectation that the United States will not become involved in military participation in the war." In his budget message the following day, he proposed an expenditure of \$8,424,000,000 for the fiscal year beginning July 1, 1940, with greatly increased appropriations for the armed forces. On Jan. 4, he appointed Attorney General Frank Murphy to the supreme court, and named Solicitor General Jackson as his successor. At the Jackson day dinner in Washington on Jan. 8, he declared that the "enormous task which the Democratic party has already performed in this generation has been to provide the energy and the confidence to steer government in the interest, and under the direction of those of our people who do not want to be selfish, and who do not want to be greedy."

On Jan. 16, in identical letters to the president of the senate and the speaker of the house, the president recommended legislation authorizing a loan to assist Finland to purchase agricultural surpluses and manufactured products, not including the implements of war, and on Jan. 19, in an address to the White House Conference on Children in a Democracy, he asserted that adequate national defence calls not only for munitions and implements of war, but also "for educated, healthy and happy citizens."

In an address of Feb. 8 commemorating the 30th anniversary of the Boy Scouts of America, the president declared that "a religious freedom is basic in Americanism." On Feb. 9 he revealed that Undersecretary of State Sumner Welles would shortly visit Italy, France, Germany and Great Britain to advise "the president and the secretary of state as to present conditions in Europe. . . . Mr. Welles will of course be authorized to make no proposals or commitments in the name of the government of the United States," he said. On Feb. 12 Mr. Roosevelt left Washington for Pensacola, Fla., where he boarded the cruiser "Tuscaloosa." After proceeding to the Panama canal, and spending a few days fishing in Pacific waters, he returned to the capital on March 2.

Following the invasion of Finland by the soviet armies, the president, in a statement given to newspaper men on March 13, declared that the people of Finland, "by their unexcelled valour, and strong resistance in the face of overwhelming armed forces, have won the moral right to live in everlasting peace and independence in the land they have so bravely defended." And on March 29, after the return of Undersecretary of State Welles to Washington, he said that the information obtained by him would be of great value when the time came for the establishment of a just and lasting peace in Europe.

On April 13, he sharply arraigned the "unlawful use of force" in the invasion of Denmark and Norway by the nazis. On April 18,

Mr. Roosevelt went to Warm Springs, Ga., for a spring holiday of about ten days. While at Warm Springs, he broadcast an address to the Young Democratic Clubs of America in which he charged that "our opponents are trying to frighten the country by telling people that the present administration is deliberately trying to put this nation into war."

In a special message on May 16, the president asked congress for an appropriation of \$1,182,000,000 for the army and navy, and 50,000 war planes. "The developments of the past few weeks have made it clear that the possibility of attack on vital American zones makes it essential that we have the physical and the ready ability to meet those attacks," he told congress. In a "fireside chat" from the White House on May 26, he urged a speeding up of the nation's rearmament effort, and on May 28 he appointed a national defence advisory commission of seven to co-ordinate the defence program. On June 10 he made his famous "stab in the back" address at the exercises of the University of Virginia and a few days later in a telegram to Premier Reynaud announced that the U.S. would not consider as "valid any attempts to infringe by force the independence and territorial integrity of France." On June 20 he named Frank Knox and Henry L. Stimson, Republicans, to be secretary of the navy and secretary of war, respectively. On July 2, he appointed Lieut. Col. Russell L. Maxwell as administrator of export control.

Though the president remained silent as to his third term intentions, his friends were active in his behalf. After the spring primaries, it was evident that only an unequivocal assertion that he would not accept the nomination, even if tendered him, could prevent his draft by the Democratic party as its 1940 candidate. On July 17, the president was renominated, on the first ballot, at the Democratic national convention at Chicago. Henry Agard Wallace, secretary of agriculture, was chosen as his running mate. Mr. Roosevelt accepted the nomination in a speech, broadcast to the convention from the White House on July 19.

In the campaign that followed, national defence and U.S. relationship to the European war took precedence over domestic issues. On July 10, the president had asked congress for a \$4,800,000 additional program of defence expansion. The Republican candidate, Wendell L. Willkie, was in substantial agreement with the president on the need for rearmament, and increased material aid to Britain. During the late summer and early fall of 1940 the president made several trips, inspecting national defence activities. On Aug. 31, he appointed Frank C. Walker to succeed James A. Farley, who had resigned as postmaster general on Aug. 8. Harry Hopkins resigned as secretary of commerce on Aug. 28.

On Aug. 18 the president conferred at Washington with Prime Minister Mackenzie King of Canada, and four days later the appointment of a joint Canadian-American defence board was announced. On Aug. 31, under authority previously vested in him by congress, he called a large number of national guard units into the federal service. In a message to congress on Sept. 3, he revealed that 50 over-age American destroyers had been traded for naval and air bases in eight British North American possessions. "This is the most important action in the reinforcement of our national defence that has been taken since the Louisiana Purchase," the president told congress.

In a speech before the Teamsters union in Washington on Sept. 11, the president urged the retention of the new deal's social gains. And on Sept. 16, he fixed Oct. 16 as the day for the first registration on the Selective Service act. In a speech at the University of Pennsylvania on Sept. 20, he declared that, "No dictator in history has ever dared to run the gauntlet of a really free election." On registration day, Oct. 16, when approximately 16,400,000 men registered for selective service, Mr. Roosevelt, in a nation-wide broadcast, asserted that "we prepare to keep the

peace in this new world which free men have built for free men to live in."

On Oct. 18, the White House announced that the president, because of a "deliberate falsification of fact by the opposition" had decided to make five speeches between then and election day. In his speech of acceptance, he had told the Democratic convention that he would not have the time or the inclination to engage in purely "political debate" during the campaign. These speeches were made in Philadelphia, New York, Brooklyn, Boston and Cleveland.

On the evening of Nov. 4, the president made a radio address from his home at Hyde Park, where he voted the following day. On Nov. 5, the president was re-elected for a third term. On Dec. 2 he boarded the cruiser "Tuscaloosa" for an inspection trip of U.S. defences in the Caribbean area. On Dec. 17, the president announced a plan to lend armaments to Great Britain, and three days later named a four-man board, headed by William S. Knudsen, to speed up the defence program and aid to Britain.

The president spent Christmas day at a family gathering in Washington. During the closing days of December, he devoted most of his time to conferences with congressional leaders, and to work on his budget and annual messages. On Dec. 29, in an address broadcast from the White House, he expressed the belief that the "axis powers are not going to win this war," and announced his determination to make the United States the "arsenal of democracy." (See also UNITED STATES.) (O. McK.)

Rosenwald Fund, The Julius. The Rosenwald fund differs from other large U.S. foundations in that the trustees are not only permitted to spend capital as well as income at any time but are compelled to expend all its funds within 25 years of the death of its founder, that is, before Jan. 6, 1957. During the 23 years since its establishment in 1917 by Julius Rosenwald, this fund has expended approximately \$16,000,000, being all of its income from year to year and about three-fourths of its principal fund. At the close of the past fiscal year, June 30, 1940, the assets of the fund (held chiefly in capital stock of Sears, Roebuck & Co. of Chicago) had a value of approximately \$4,500,000.

The chief program of the fund during its early years was aid in the building of rural public schools for Negroes. The main programs at present are (1) improving the content and quality of rural education in both white and Negro schools in the south; (2) aid in building up four important centres of higher education for Negroes: Howard university in Washington, D.C., Atlanta university in Atlanta, Ga., Fisk university in Nashville, Tenn. and Dillard university in New Orleans, La.; (3) efforts in behalf of Negro health; and (4) a series of fellowships for Negroes and for white southerners. During the year 1939-40 the fund expended \$527,000 upon these and related programs.

Rosny, Joseph Henry, joint pseudonym of the French novelist Séraphin Justin François Boëx, and his brother, Joseph Henri Honoré Boëx (1856-1940). The latter died Feb. 14. For their biography see *Encyclopædia Britannica*, vol. 19, p. 561.

Rostron, Sir Arthur Henry (1869-1940), English sea captain, was born in Bolton, England, May 14, and was educated at the Bolton high school and Her Majesty's School Ship "Conway." He served on sailing ships until 1895, when he was employed as fourth officer on one of the Cunard ships. He rose in rank until he was commodore of the Cunard fleet from 1928 to 1931. He was in command of the "Carpathia" in 1912 when that ship rescued many survivors

of the "Titanic" disaster. The U.S. congress gave him a gold medal in recognition of his services at that time, and he was made a Chevalier of the Legion of Honour by France. He died in Chippenham, Eng., Nov. 4.

Rotary International. Between Jan. 1 and Dec. 31, 1940, membership in Rotary clubs in approximately 80 geographical divisions of the world grew from 209,000 to 212,671; the number of clubs increased from 5,030 to 5,057, despite the loss of clubs and members in many of the countries which were subjected to totalitarian domination. General officers for 1940-41 (term ending June 30, 1941) were: president, Armando de A. Pereira, São Paulo, Brazil; vice-presidents, Allison Ware, Chico, Calif., U.S.A.; T. A. Warren, Wolverhampton, England; Cesar D. Andrade, Guayaquil, Ecuador; secretary, Chesley R. Perry; treasurer, Rufus F. Chapin. The usual Rotary activities included in 1940 an international convention in Havana, Cuba, June 9 to 14 and the holding of institutes of understanding, world-wide participation in Rotary Observance week (Feb. 18-24), and activities for the alleviation of war suffering. Rotary International publishes *The Rotarian* in English and *Revista Rotaria* in Spanish. About 25 regional Rotary magazines are published in some 15 languages. (C. R. P.)

Rothermere, Harold Sidney Harmsworth,

1ST VISCOUNT (1868-1940) British publisher, was born in London, April 26, and died in Hamilton, Bermuda, Nov. 26. For a biographical sketch see *Encyclopædia Britannica*, vol. 19, p. 573.

Rowing. The 1940 intercollegiate rowing season opened in the U.S. on April 20 with three regattas. On Lake Washington the University of Washington defeated the University of California by two lengths in a hard fought race over the three-mile distance to win the Pacific coast championship. Washington also won the junior varsity race, but lost to the California freshman eight by half a length. On Lake Carnegie, Princeton won over the Naval academy by a margin of one and one-half lengths. In the junior varsity race, Navy crossed the finish line only a few feet ahead of Princeton. On the Harlem river, Columbia easily defeated Rutgers and Manhattan in three races.

Columbia won its second race of the year in an easy victory over three crews from the Navy, April 27, on the Severn river at Annapolis. Harvard opened its season with clear-cut victories over Syracuse, Massachusetts Institute of Technology and Boston university in varsity, junior varsity and freshman races. On the same day, Pennsylvania in its first race defeated Rutgers.

On May 4 the two remaining major rowing universities made their debut of the 1940 season. Yale defeated Columbia and Pennsylvania on the Harlem river in one of the hardest fought races of the year for the Blackwell cup. Columbia's junior varsity and freshman crews remained undefeated in close races. Cornell won over Navy in the varsity and freshman races, but lost to the Navy junior varsity at Annapolis. In the third regatta on this day the Harvard varsity and junior varsity defeated M.I.T. and Princeton on Lake Carnegie to win the Compton cup for the fourth successive year.

Yale won its second victory of the season on the following Saturday at Derby in another tight, hard fought race. M.I.T. was nosed out in the final quarter mile, with Syracuse, the third entry, only a length behind M.I.T. The Yale junior varsity boat won and M.I.T. showed marked superiority in the freshman race. The Columbia crews finished their sprint season with a clean sweep in the Childs cup race on the Schuylkill river, May 11. In the varsity race Columbia won over Pennsylvania by a length

and Princeton by two lengths.

Harvard won the Adams cup for the third consecutive year on May 18 at Philadelphia. An improved Pennsylvania crew placed second, a length behind Harvard and a length in front of Navy. The Pennsylvania junior varsity won its first major race of the year by defeating Navy by one second, with the Harvard junior varsity in third place. Harvard's fine freshmen remained undefeated by an easy victory over the Navy plebes and the Pennsylvania freshmen. This same Saturday saw Cornell, Yale and Princeton fighting over the two-mile course on the Housatonic river at Derby for supremacy in the Carnegie cup regatta. Cornell, content to stay in third place for most of the race, drove over the finish line to defeat Yale by a fifth of a second. Cornell established a new course record of 9:33 $\frac{2}{5}$.

May 25 brought the only two undefeated crews in the east together. Rowing in a driving rain over the two-mile course on Lake Cayuga, a great Cornell crew defeated Harvard by a length and a half to win the sprint championship of the east. Syracuse, a crew that had been handicapped in its earlier races due to an unusually bad spring, finished only a few feet behind Harvard. In their last race of the year, Pennsylvania defeated the University of Wisconsin and Marietta college in the Allegheny regatta at Pittsburgh. The Poughkeepsie regatta, June 18, held an unusual amount of interest. Eight varsity crews (Princeton entering the race for the first time in its history) formed the largest field in several years. Washington, the Pacific coast champions, and Cornell, the only undefeated crew in eastern waters, were pre-race favourites for the four-mile Hudson river race. Washington lived up to its past record and won on a stormy windswept river that had almost caused postponement of the race. Cornell remained the best crew in the east by finishing only a length behind Washington.

The college rowing season was brought to a close by the 78th annual four-mile Yale-Harvard regatta on the Thames river, June 21. Starting at the railroad bridge at New London, a veteran and smooth-rowing Harvard eight faced a lighter, inexperienced Yale crew. Yale jumped to a slight lead in the first quarter mile. Rowing at a lower stroke, Harvard soon forged to the front and at each mile flag had increased its lead until it crossed the finish line at Bartlett's Cove seven lengths ahead of Yale. Harvard made a clean sweep of the regatta, having won the freshman and junior varsity races in the morning. The Harvard victory brought the score exactly even in this old series, 39 races apiece. Rutgers won over a field of nine entrants in the second Dad Vail regatta, May 18, on the Connecticut river at Springfield, Mass. Harvard won the annual Joseph Wright cup race at Boston for the championship in the lightweight division of college rowing for the second consecutive year.

Ruanda and Urundi: *see* BELGIAN COLONIAL EMPIRE; MAN-DATES.

Rubber, Synthetic: *see* CHEMISTRY; STANDARDS, NATIONAL BUREAU OF.

Rubber and Rubber Manufacture. By far the most important development in 1940 was the expanded use of synthetic rubbers. The consumption of neoprene increased and new varieties of synthetics were developed. Ameripol, butyl rubber and Chemigum, introduced during 1940, were all new products of U.S. origin useful either for replacing for special purposes Perbunan (no longer available), or, should imports of crude rubber be interrupted, for general use in place of the natural product. Though considerably above the market price of crude rubber, the cost of synthetics should with large scale production approach these market levels.

Certain esters such as are used for plasticizing synthetic resins were found useful also for modifying the properties of synthetic rubber compositions. As softeners for rubber the use of products made by polymerization of cashew-nut shell liquor greatly increased. The development of electrically conducting articles promoted the use in rubber compositions of carbon black produced from acetylene. Two new finely divided precipitated pigments appeared on the market—one a calcium silicate, one a calcium carbonate. In the processing field, a new system of handling batches of rubber compositions from Banbury mixers was extensively adopted. Instead of dividing the batches into three parts for separate sheeting, blending and cutting by hand, the new process automatically cuts and blends the stock, transfers it from mill to mill, forms and dusts slabs and places them on a cooling conveyor. Handling costs are thus greatly reduced. Another process was developed for automatically cutting plasticated rubber into coarse pellets, dusting them and conveying them by air to storage bins from which they are discharged by gravity at the weighing tables. This process facilitates handling at lower cost.

The government's program for national defence required the development of numerous new products. Means were devised for protecting gasoline and oil tanks and tires both on aeroplanes and road vehicles against leakage after puncture by projectiles. Rubber structures, reinforced by metal cables and crossplates embedded in the rubber were adopted for many military vehicles in place of jointed metal bands for tractor-type drives. The rubber tracks are lighter, wear less rapidly, require no lubrication and may be operated at considerably higher speed. Among tire developments were the production and sale of tires made with Ameripol; the development of oil-resistant industrial tires for use where contact with lubricants is unavoidable; change in design whereby, in order to increase stability and improve traction, the ratio of rim width to cross-sectional width of tires was increased; the use of cushion tires instead of pneumatics on the small tail landing wheels of aeroplanes; design of white-side tires was changed to apply white on one side only, to be mounted on the outer side of the wheel; as a result of the trend in automobile design the proportion of tires manufactured with small rim diameters increased. Synthetics made possible the development of flexible, electrically conducting gasoline hose nozzles, hose for handling butane and propane and covers of belts for conveying oil-treated coal. Rubber pads for the Guerin process of forming sheet metal, especially aeroplane parts, greatly reduced the cost of dies, the deformability of rubber making it suitable for use with dies of different sizes and shapes. Improvement in the method of attaching rubber printing plates in the presses reduced the cost of ink used in printing a "best seller" by 25% and the "make ready" cost preparatory to printing by two-thirds. The development of a new type of printing ink which is melted on the feed rolls and sets by chilling instead of by oxidation required the use of synthetic rubber rollers which would maintain the necessary degree of hardness at elevated temperatures. A method was devised for covering rollers for paper manufacture by attaching the rubber to a metal sleeve to be slipped over the roll core instead of adhering it to the core directly. This avoided the necessity of shipping heavy roll cores to the rubber manufacturer and saved in time required for replacement.

The use of plasticized polyvinyl chloride for electrical insulation increased greatly and wrist watch straps, suspenders, belts, garters and dog collars were made of this material in a variety of colours.

Rumania, a kingdom in southeastern Europe, had on Jan. 1, 1940 an area of 113,919 sq.mi. and a population of 19,900,000. During the year 1940 Rumania lost large parts of its territory to the soviet union, to Hungary and to Bulgaria. On June 27 the soviet union occupied the former Russian province of Bessarabia and the former Austrian province of northern Bukovina, territories with about 4,000,000 inhabitants and containing Rumania's second and third largest cities, Kishinev with 113,000 and Cernauti with 110,000 inhabitants. On Aug. 30 Rumania was forced by the Vienna dictate of Germany and Italy to cede northern Transylvania with 2,370,000 inhabitants to Hungary, and the treaty of Craiova of Sept. 7 gave the former Bulgarian province of southern Dobruja, with a population of 350,000, back to Bulgaria. This dismemberment of Rumania was the consequence of events connected with the general European situation and was accompanied by violent changes in the internal structure of the Rumanian state.

Rumania's internal order had been shaken by the emergence of the Rumanian fascist party, the Legion of the Archangel Michael, which had been founded in 1927 in Jassy by Corneliu Zelea Codreanu. This party, claiming to work for the racial and religious regeneration of Rumania on a national and Greek Orthodox basis, was violently anti-democratic and anti-Semitic and demanded a close co-operation with national socialist Germany and fascist Italy. Its political section, the Iron Guard, not only succeeded in gaining a large number of adherents among the youth, especially in the universities, in the officers' class and in the clergy, but also arranged a number of political assassinations of leading Rumanian personalities, among them Prime Minister Armand Calinescu. Against these excesses and anarchistic tendencies King Carol II tried to establish order by imprisonment and mass executions of Iron Guard leaders, Codreanu among them, and by a royal dictatorship which sought to protect the independence of the country by a policy of strict neutrality. The German-Russian treaty of Aug. 1939, the growing successes of national socialist Germany in the European war, and as a consequence the increasing audacity of the Rumanian fascists, put King Carol's regime into a very precarious position, so that on Sept. 6 he was forced to abdicate and leave the country, and his son Michael was proclaimed king. The real power passed into the hands of the Iron Guard, and Rumania changed from a royal dictatorship into an outright fascist state, which at the same time came entirely under German overlordship, was occupied by German troops and thus placed in the position of a German protectorate.

At the beginning of 1940 Rumania, whose independence and integrity had been guaranteed in April 1939 by Great Britain and France, played off the two opposing groups in Europe one against the other. Germany, whose strategic position along the Danube rendered it especially dangerous to the independence of Rumania, was most eager to receive a practical monopoly over Rumania's foreign trade, especially over Rumania's exports of oil and wheat; on the other hand, Rumania looked for the protection of her independence to Great Britain and to Turkey, Britain's ally, and therefore had to satisfy as far as possible British economic demands, especially in view of the fact that the Rumanian oil fields belonged largely to British, French and American companies and that Rumania wished to receive for her exports foreign currency, which she could not get from Germany, who restricted all her transactions purely to barter.

At the last opening of the parliament on March 7 King Carol in the speech from the throne stressed Rumania's will to maintain a strict neutrality and discussed the steps taken by the country in order to put itself on a war basis, so as to be able to protect this neutrality. But the king was soon forced to proclaim an amnesty for many of the Iron Guard leaders, while the successor

MAP showing territories ceded by Rumania to the U.S.S.R. (Bessarabia and northern Bukovina), Hungary (northern Transylvania) and Bulgaria (southern Dobruja) in 1940

of Codreanu, Horia Sima, returned from exile in Germany and resumed the leadership of the party. The Rumanian prime minister, George Tatarescu, expressed the hope that, in view of the external danger threatening the existence of the state and the national heritage, all parties would unite in a common defence of the fatherland. This hope proved to be in vain. The fascist party continued its destructive work, the final result of which was the dismemberment of Rumania and its complete subjection to Germany. Under increased German pressure and with the mounting tide of German successes on the western front, Foreign Minister Grigore Gafencu resigned on June 1 and was replaced by Ion Gigurtu, an adherent of a complete pro-axis orientation. On June 21 King Carol made an attempt to reorganize his government along strictly fascist lines, but his efforts were interrupted by the ultimatum from the soviet union which demanded the cession of Bessarabia and northern Bukovina. Under German pressure the Rumanian government complied with the demand, and on July 1 it renounced the guarantee received from Great Britain and France in 1939. The German air force occupied the country under the pretext of protecting the oil fields against a British attack. On July 4 Ion Gigurtu became prime minister and Horia Sima, the leader of the Iron Guard, became minister of education and enlightenment. British engineers and oil experts were ordered to leave the country immediately; the largest oil company was taken over by the Rumanian government, which established a monopoly over the exploitation of the oil fields and the export of the oil.

Negotiations with Hungary about Hungary's claim to Transylvania lasted for several weeks and created much bitterness between the two countries. Hungary claimed the largest part of Transylvania, which until 1918 had formed part of Hungary, but was predominantly inhabited by Rumanians and was regarded by them as the most progressive and nationally conscious part. Finally the German and Italian governments decided the dispute in a way which satisfied Hungary, but left the Rumanian population bitterly hostile. The award of Vienna did not try to find an ethnographic frontier in Transylvania, nor to do justice to linguistic or historical considerations; it was dictated entirely by the strategic and political interests of the axis powers. Much less antagonism was caused by the cession of southern Dobruja to Bulgaria. This quadrilateral plain between the lower Danube and

the Black sea had formed part of Bulgaria until 1913 and was inhabited by a Bulgarian majority. In view of the dismemberment of Rumania, Germany guaranteed the frontiers of the state as they emerged after the three territorial cessions. Under this pretext German troops occupied the country. The number of German soldiers was put at the end of 1940 as high as 600,000 men by some sources.

The ensuing unrest and the violent dissatisfaction which the cession of northern Transylvania provoked forced the king to name General Ion Antonescu dictator, a man who leaned upon the Iron Guard for the establishment of his government. This move did not, however, insure orderly administration. King Carol was forced to abdicate and left the country for Spain. His son and successor was king only in name; the real power was in the hands of Antonescu and the Iron Guard, which proceeded to avenge the execution of its former leaders. A large number of prominent Rumanian statesmen, former ministers, generals and high police officers were arrested. An earthquake on Nov. 10, which caused considerable damage, though the exact extent was withheld from the public by censorship, aggravated the situation. On Nov. 23 Rumania signed in Vienna its official adhesion to the Berlin-Rome-Tokyo pact. On Nov. 27 the Iron Guard started a week of massacre and terrorization throughout the country. Sixty-four of the arrested dignitaries were executed over the graves of Codreanu and 13 other Iron Guard leaders who were now exhumed and buried a few days later with the greatest pomp. Among the numerous victims of the widespread disorders was the leading historian and scholar of international repute, Professor Nicolas Jorga. Though General Antonescu succeeded in restoring order, internal strife continued for the rest of the year. (See also BALKAN ENTENTE; EUROPEAN WAR.) (H. Ko.)

Rundstedt, Rudolf Gerd von (1875-), German soldier, was born Dec. 12 at Aschersleben, descendant of a noble family of Brandenburg. He entered the officers' training school at the early age of 12, received his commission, pursued further military studies at the academy of war and joined the general staff in 1907. At the start of war in 1914 he commanded a company in Alsace, then after a period of service with the general staff saw action on the eastern front in Galicia and northern Poland. It was in the latter regions that he acquired military fame in 1939 during the Polish campaign. His troops first stormed the Jablonica pass, then marched far into Galicia. He was in command at the fall of Cracow, Lodz and Przemysl. The battles of the river San and the bend of the Vistula, and the entry into Warsaw were further milestones in Gen. Rundstedt's career. For these accomplishments and for his successes during the invasion of the Low Countries and France in 1940 he was created marshal of the reich July 19, 1940.

Rural Electrification. The accelerated pace in rural electrification in the United States, which received its impetus in 1935 with the establishment of the Rural Electrification administration, continued during the year 1940, the estimated number of farms with central station service approaching 2,100,000 in comparison with 1,700,000 at the end of 1939. In terms of the percentage of farms with electricity, the progress in 1940 was the greatest in the development of rural electrification, the percentage increasing from 25 in 1939 to an estimated 30 at the end of 1940.

The approximate number and percentage of electrified farms at the end of previous years were as follows: 1934, 744,000 farms,

10.9%; 1935, 789,000 farms, 11.6%; 1936, 1,043,000 farms, 15.4%; 1937, 1,242,000 farms, 18.2%; 1938, 1,407,000 farms, 20.5%. Prior to 1935 substantially all electrified farms received power from private utility companies; after 1935, rural electric service was furnished by both private companies and co-operative, non-profit enterprises. Over 99% of the federal rural electrification loans was made to the latter type of enterprise, essentially a community owned and operated business.

In response to the demands of rural communities for electric service during fiscal 1940 congress increased its authorization for rural electrification loans during fiscal 1941 from \$40,000,000 to \$100,000,000. By Dec. 31, 1940 Rural Electrification administration had allotted a total of \$351,454,621 to finance on a self-liquidating basis the construction of rural electric systems comprising about 338,000 mi. of line to serve more than 1,119,000 rural consumers. At the close of the year 1940 approximately 270,000 mi. of these systems were in operation serving some 675,000 consumers in contrast to 181,000 mi. serving 435,000 consumers at the end of 1939. About 80% of these were farms, the balance consisting of schools, churches, commercial establishments and many types of rural industries.

As a result of the war in Europe and the national defence program of the United States, rural electrification was assuming, perhaps unexpectedly, an important new role in furnishing power for decentralized defence industries and military establishments. A study by the National Defense commission revealed that in both England and Germany quantities of war matériel were being produced in small rural workshops and shipped to assembly points. In the United States rural electric systems were serving army camps, aeroplane beacons, communication systems and many small industrial plants whose facilities were becoming increasingly important to the national defence program. During 1940 several rural electric co-operatives obtained mobile generating plants which were mounted on trailers and might be used to provide emergency service to essential defence industries or for military purposes.

In addition to wider availability of electric power in rural areas in 1940, farm consumption of power in the United States continued to increase and there was some further reduction in rates. Wider application of electric power to farm operations received an increasing amount of attention from agricultural colleges and research agencies of the department of agriculture. An appliance survey made by REA-financed systems during the spring of 1940 showed the percentage of relatively new farm consumers of electricity who acquired various appliances and equipment, among which were: radios, 87.5%; irons, 84.1%; washing machines, 55.3%; refrigerators, 31.6%; water pumps, 15.3%; fractional horse-power motors, 14.5%; and poultry lights, 10.5%.

In order to serve areas of low income and low density on an economical basis, a limited number of self-help projects were financed by the Rural Electrification administration during 1940. Under the self-help plan the farmer members of the co-operative performed the common labour required in constructing the system; such as digging pole holes, clearing right of way and trimming trees, for which they received credits. These were applied against the cost of wiring their houses or the purchase of appliances and equipment. Group purchase plans for obtaining electrical appliances and equipment at quantity discounts were developed and used more extensively by farm members of rural electric co-operatives during 1940.

Great Britain.—Information concerning rural electrification developments in England was in 1940 dependent on technical journals because publication of statistics was temporarily suspended by the electricity commissioners. Wartime conditions

SEVERAL HUNDRED THOUSAND U.S. farm people attended the Rural Electrification administration's travelling "Farm Equipment Show" in 1940

were the dominating influence on rural electrification developments in England during 1940, according to British technical journals. An article in the *Electrical Review* (London) for Aug. 1940, for example, reported "home food production is very much in the news at the moment, and the nation may well thank those electricity supply authorities which, by their enterprise in providing supplies to sparsely populated and barely remunerative rural areas, are now making it possible for farmers to employ electrical methods to aid food production and storage." Because of the labour shortage in rural areas, electric power was of increasing importance to farmers in carrying on their increased responsibilities with a minimum of labour. The single-strand electric fence was used extensively during the year to overcome the obstacle to the plowing up of grasslands created by a shortage of timber for fencing. There was also a reported increase in the use of crop dryers for threshed corn, grass and clover.

Difficulties in obtaining materials somewhat retarded rural extensions during the year, it being reported by the *Electrician* (London) that electricity was giving 100% service on well over 40,000 farms but that there were some 160,000 additional farms justifying an intensified use of electric power. In order to encourage the development of rural areas and overcome the adverse influences of cost contributions to line extensions, the president of the Institution of Electrical Engineers in Oct. 1940 proposed that the general availability of electric power should be made compulsory within a limited time. While the war did not materially alter the domestic use of electricity during the year, there was a reported shortage of materials which resulted in a restricted production and supply of electric appliances. (R. B. C.)

Rural Electrification Administration (REA): see RURAL ELECTRIFICATION.

Russell Sage Foundation. The Russell Sage Foundation was created by Mrs. Russell Sage in 1907 as a memorial to her husband. Its purpose is "the improvement of social and living conditions in the United States of America."

The original gift by Mrs. Sage was \$10,000,000, to which she added \$5,000,000 in her will. The income of the Foundation in 1940 was approximately \$570,000.

Among its more recent publications are: *Civil Service in Public Welfare* by Alice Campbell Klein; *The English Hire-Purchase Act* (1938) by John E. Hamm; and *Migration and Social Welfare*

by Philip E. Ryan.

(S. M. HA.)

Russia: see UNION OF SOVIET SOCIALIST REPUBLICS.

Russian S.F.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Ruthenia, or Carpathian Ukraine, was formerly the eastern-most part of the Czechoslovak republic. For a brief time in 1938 and 1939 Ruthenia entered the full limelight of history because the national socialist government tried to make it a spearhead for the penetration of national socialist propaganda into the soviet Ukraine and into Polish Ukraine. During that time an active Ukrainian nationalist movement was promoted in Ruthenia to become the rallying point for the creation of a great Ukraine which would unite all the 45,000,000 Ukrainians then divided among the soviet union, Poland, Rumania and Czechoslovakia. This plan was ended when in March 1939 Hungary occupied Ruthenia. At that time the occupation created a common Polish-Hungarian frontier, which was regarded by some as a possible check to German expansion eastward, especially in view of the fact that the Polish and Hungarian governments were connected by close and long-lasting ties of friendship. The conquest of Poland by Germany not only put an end to these plans but created a common frontier of Hungary and the soviet union. With the annexation of eastern Poland in Sept. 1939, and of northern Bukovina in June 1940, the soviet union comprised within its territory all the Ukrainians with the exception of approximately 500,000 in Ruthenia. There were repeated rumours that the soviet union would also try to incorporate Ruthenia, but such a move would be strenuously resisted not only by Hungary but also by Germany, which did not wish soviet troops to cross the Carpathian mountains. In view of that situation the Hungarian government in 1940 curtailed the small measure of autonomy granted to Ruthenia and proceeded to Magyarize the territory, thus hoping to put an end to the Ruthenian question.

(H. Ko.)

Rye. Production of rye in the U.S. in 1940 was but slightly above pre-drought averages owing to a decrease in acreage. The 1940 crop was estimated Dec. 1 by the department of agriculture as 40,601,000 bu. compared with 39,049,000 bu. in 1939 and a ten-year (1929-38) average of 38,095,000 bu. Yield per acre in 1940 was 12.7 bu. In 1939 the acre yield was 10.2 bu. and for the ten-year average it was 11.4 bu. The 1940 rye crop in Canada was officially estimated at 14,593,000 bu. from 1,035,000 ac., compared with 15,307,000 bu. from

1,102,000 ac. in 1939. The five-year (1933-37) average production in Canada was 10,988,000 bu., with the average acreage sown to rye as 701,000 acres. Rye is classed among the feed grains in North America and is not a large crop. In Europe where it is grown much more extensively, especially in Germany and Poland, it takes a more important part among the bread grains. Owing to wartime restrictions on agricultural statistics in many countries, data from principal rye-producing countries were not available. The 1940 crop in Sweden was reported as 11,653,000 bu. compared with 14,893,000 bu. in 1939. A short crop was also reported in Yugoslavia, about 9,800,000 bu. of rye and maslin, of which approximately 9,000,000 bu. was rye. Rye seeded in the United States in the autumn of 1940, for harvest in 1941, was estimated at 6,002,000 ac. (See also CERFALS.) (S. O. R.)

Sabry Pasha, Hassan (1879-1940), premier of Egypt and one of its most distinguished statesmen. He was minister to London in 1934 and 1935, having served previously as minister of finance. In 1936 he entered the cabinet as minister of communications, commerce and industry. He was minister of war in 1939, but resigned in protest against the reduction of the pay of officers. On June 27, 1940, he became premier, but resigned on Aug. 27. The king, however, persuaded him to continue in office. Sabry died in the Egyptian parliament at Cairo, Nov. 14, while reading King Farouk's message from the throne.

St. Louis, largest city in Missouri and eighth largest in the United States, had in 1940 a population of 816,048. This figure, a 0.7% decrease in comparison with the 1930 census, is not indicative of a lack of growth, but of a population shift to suburban areas. This is evidenced by a new high, 1,087,066, in the combined population of the city and contiguous St. Louis county, an increase of 5.2% in a decade.

By the end of 1940, St. Louis appeared to have won a 50-year fight against one of its most formidable problems, the smoke nuisance. Chiefly responsible was a drastic ordinance which, with other strong regulations, prohibited use of coal having less than 23% volatile matter in any except mechanical fuel burning equipment. The effect was to reduce the use of cheap, smoky coal.

The historic levee district, a blighted area which has been turned into the site of a national park memorializing Thomas Jefferson and the westward pioneer expansion, was four-fifths razed by the close of 1940 and the federal government had granted \$1,015,460 to landscape and beautify the 40-block area.

Work was begun on the city's first two federal housing projects which will cost \$7,000,000 and accommodate 1,400 families. Public building by the city was confined largely to hospital improvements, on which \$2,000,000 was spent. Private building again showed an increase in 1940. It approximated \$13,700,000, an increase of 22%.

The financial condition of the city, always sound, improved in 1940. The municipal deficit stood at \$1,682,729, after a \$1,649,851 reduction in 12 months, was expected to be further lowered or even wiped out in 1941. Outstanding indebtedness was \$72,252,000, the lowest since 1931; revenue receipts were \$21,059,685, the highest since 1932. Assessable value of real and personal property was \$1,055,416,742. An estimated \$200,000,000 came

to St. Louis before the close of 1940 in contracts for manufactures and construction of plane and armament plants.

Saionji, Kimmochi (1849-1940), Japanese prince and statesman, was born in October at Kyoto and died on Nov. 24 in his villa at Okitsu. For a biographical sketch see *Encyclopædia Britannica*, vol. 19, p. 863.

Sales: see RETAIL SALES.

Salt. Scarcely any country on the face of the earth, civilized or uncivilized, fails to contribute in some degree to a total salt output that was estimated at 35,600,000 metric tons in 1937. The United States leads in production, with 28% of the total, followed by the Soviet Union, 14%, Germany 11%, the United Kingdom 10%, China 9%, France 7%, India 5% and Italy 5%. The United States' output reached a record figure of 9,278,000 short tons in 1939, while Canadian output was 425,000 tons. (G. A. Ro.)

Salvador, El, the smallest of the Central American republics, located on the Pacific coast; language, Spanish; capital, San Salvador; president, General Maximiliano Hernández Martínez. The area is 13,172 sq. mi. The population by the 1937 census was 1,631,967 and was officially estimated at 1,744,535 on Dec. 31, 1939, with 37½% urban. The chief cities, with 1940 estimates of population (including immediately adjacent rural areas) were: San Salvador, 104,000; San Vicente, 90,000; San Miguel, 44,100; Nueva San Salvador (or Santa Tecla), 33,000; Ahuachapán, 30,775; Sonsonate, 21,000; Santa Ana, 18,000.

El Salvador was quiet and politically stable throughout 1940, although some alarm was felt over fifth column activities in the latter months of the year. Following popular resentment over a parade of Italian residents in celebration of Italy's formal entry into the European war, all foreign political activity was proscribed by law on June 13. Later, a German consul was expelled. Economically, the country was hard hit by the closing of European markets which formerly absorbed 35% of its coffee exports, and the carryover at the end of the 1940 season (Aug. 31) was double that of 1939. Considerable relief was anticipated, however, from the Inter-American Coffee agreement of Nov. 1940, which allotted El Salvador 600,000 bags of 60 kg. for export to the United States (1939 exportation: 433,870 bags).

External communication is principally by sea and by Pan American Airways, supplemented by the Pan-American highway. There are 602 km. of railway. The 3,611 km. national highway system, already the best in Central America, is being rapidly expanded and improved. It includes 220 km. paved and 2,299 km. improved dirt roads and is complemented by 12,029 km. of local roads.

In 1939 exports were 31,875,665 colones (United States, 60.9%; Germany, 9%; Norway, 7.2%; Sweden, 4.3%; Honduras, 4.1%; Guatemala, 3.8%). Aside from coffee, the chief exports are gold and silver, sugar, balsam and henequen. The principal products are corn, which, along with considerable sugar and cotton, is produced for domestic consumption, and coffee for export. In 1940 corn and other food crops were generally subnormal. Coffee normally accounts for around 90% of export values (83.7% in 1939). During 1939, 62.9% of coffee exports went to the United States. There were 11,545 coffee plantations, over 92% of them owned by Salvadoreans, with 139,940,727 coffee trees in bearing in 1939. An area of 202,432 ac. is devoted to coffee.

The monetary unit is the colón (value: 40 cents U.S.). The 1940 budget estimated receipts at 21,321,650 colones, expenditures at 21,317,073 colones, with 14.6% allotted to education.

There were 1,296 primary schools, with an enrolment of 89,839 in 1938, 44 secondary and normal schools, and one university. (L. W. BE.)

Salvation Army.

During 1940 the Salvation army celebrated its diamond jubilee, marking the 75th anniversary of the organization's founding by William Booth among the poor of London's East End in 1865. Observances were held in 97 countries and colonies where the army is carrying on its social and religious program. In contrast to its humble origin under one leader in a tent in Whitechapel, London, the 20,667 Salvation army institutions were in 1940 directed by 27,417 men and women officers who employed 104 languages or dialects in their labours. In the prosecution of its work the army published 126 periodicals, printed in many languages, with a combined circulation of 1,441,783 copies per issue.

The diamond jubilee also commemorated the 60th anniversary of the founding of the army's work in the United States. On March 10, 1880, Commissioner George S. Railton and seven officers arrived at Battery park in New York city from London, with the one purpose of reaching the poor and unchurched of the U.S. with a message of hope. From a single street meeting in 1880 the work of the Salvation army in 1940 was nationwide. Directed by 4,800 officers in 2,000 centres, the activities of the army in the United States in 1940 included: evangelistic meetings; shelters for men and women; rehabilitation centres for men; homes and hospitals for the unmarried mother and her child; clinics; children's homes; individual and family welfare; aid to prisoners and their families; free employment bureaus; search for missing relatives; summer outings for women and children; camps for children and youth; young people's social and religious instruction.

The administration of the organization in the United States is divided into four territories, each conducting a training college for officers and issuing weekly the *War Cry*, the official gazette. Commissioner Edward J. Parker, the national secretary, with headquarters at 120 West 14th st., New York city, co-ordinates administrative matters for the four U.S.A. territories.

The territorial commanders are: (Eastern) Commissioner Alexander M. Damon, 120 West 14th street, New York city; (Central) Commissioner Ernest I. Pugmire, 713 North State street, Chicago, Ill.; (Southern) Lt.-Commissioner William C. Arnold, 54 Ellis street, Atlanta, Ga.; and (Western) Lt.-Commissioner Donald McMillan, 115 Valencia street, San Francisco.

In addition to its regular social and religious program, the army during 1940 increased its welfare work among the combatant nations of the war in Europe and Asia.

During the conflict in Finland, Salvationists aided the government in its evacuation and resettlement program. Other Salvationists in Belgium and France, Germany and Holland, Norway and Denmark, England and Italy ministered to the fighting forces, accompanied refugees and gave aid to the stricken and shelterless. In France alone, the Salvation army operated 17 huts, 26 other buildings, 18 canteen-ambulances, until they were destroyed by the ravages of war. In England five departments of the Salvation army were wholly occupied with war relief activities.

Salvationists and friends in the United States contributed \$194,667.02 for relief work abroad and collected more than 500 tons of clothing. (E. J. PA.)

Samoa, American,

a possession of the United States of America, lies about 2,700 mi. east of

the northern tip of Australia and 2,200 mi. south of the Hawaiian islands; comprises the island of Tutuila and all other islands of the Samoan group E. of longitude 171° W., including Rose island, Tau, Olosega, Ofu, Aunuu, and Swain's. The principal island is Tutuila, area about 40 square miles. Pago Pago, the capital, population about 1,000, has the safest and best harbour in the South seas. Total population on June 30, 1940, 12,962, including 12,594 natives of Samoa (Polynesians); the remainder are foreign born and personnel of the U.S. naval establishment.

Public schools had an average enrolment of 2,770 during 1939-40. Health and sanitary conditions are excellent. All medical attention is given by naval medical officers who treat the natives free of charge. The only bank is the Bank of American Samoa, conducting a commercial banking business as a division of the treasury of the naval government of American Samoa, which owns the capital stock. Copra is the chief export of importance: 766 tons, returning \$28,473, were exported during the copra crop year ending Jan. 31, 1940; 277 tons of mats, rugs and native curios, returning \$50,204, were also exported during the fiscal year ending June 30, 1940. Imports: from U.S., \$76,741; from New Zealand-Australia, \$89,644; other, \$9,141. The island has no indebtedness and receives no financial aid from the U.S. government. (L. S. F.)

Samoa, Western: see MANDATES; PACIFIC ISLANDS, MANDATED.

Sand and Gravel.

The leading uses of sand and gravel are in building construction and road paving; these account for 80% of the sand and 90% of the gravel consumption of the United States; the only other important use of gravel is as railroad ballast, which takes all but 1% of the remainder, but with sand, ballast accounts for only 2%, while the railroads use an additional 3% as engine sand; there are a number of industrial uses, the most important ones being in foundry work (8%), glass making (4%), and abrasives (1%). The total production increased by 7% in 1939, as compared with 1938, reaching 67,078,000 short tons of sand and 127,740,000 tons of gravel, a total of 194,818,000 tons.

The combined output of sand and gravel in Canada decreased by 12% in 1939 to 28,172,000 short tons. Production in the United Kingdom is less than in Canada, amounting to 17,796,000 long tons in 1938. Of this total 74% was used by the building industry and 17% for road metal and ballast. (G. A. RO.)

Sandefur, Jefferson Davis

(1868-1940), president of Hardin-Simmons university, Abilene, Tex., was born on a farm in Sharp county, Ark., March 13. He was a student at the summer school of the University of Texas for three years and in 1907 received a Ph.D. degree from the University of Chicago. After serving as president of Strawn college and John Tarleton college, and acting as superintendent of schools, he was elected president of Simmons college in 1909, which later became Hardin-Simmons university. He was one of the leaders of the Baptist church in Texas and served as president of its general convention. He died in Abilene, March 22.

Sand Island: see MIDWAY ISLANDS.

Sandstone: see STONE.

San Francisco,

California, U.S.A., central port, financial and marketing centre of the Pacific coast, known as the "City by the Golden Gate"; area, 44.82 sq.mi.; population according to the U.S. census of 1940, 634,536. Of the city's population in 1930, 235,298 were native whites of native parent-

age, or 37.1%; 206,285 native whites of foreign or mixed parentage, or 32.5%; 153,386 foreign born whites, or 24.2%; 39,425 Negroes or of other races, or 6.2%; 338,033 males and 296,361 females.

History.—National defence contracts, and contracts awarded by the British government to manufacturers in San Francisco and the Bay area by Jan. 1, 1941, amounted to more than \$600,000,000, of which approximately 85% was shipbuilding.

During the 382 days of the Golden Gate International exposition in 1939 and 1940, 2,530,643 tourists spent \$328,762,470 in the state of California, which was \$71,600,000 over the normal travel year of 1938.

Education.—There were 181 public schools in San Francisco, including 72 kindergartens, 82 elementary schools and 26 high schools, supplemented by numerous private, parochial, non-sectarian and technical schools. It was estimated that there were several thousand children in the city attending private schools. The University of San Francisco and the San Francisco State Teachers' college are located in the city, and the University of California at Berkeley and Stanford university at Palo Alto are both within easy commuting distance of San Francisco. In addition, the University of California maintains several branches in San Francisco, including colleges of medicine, dentistry, pharmacy and law, and the California School of Fine Arts; Stanford university's colleges of dentistry and medicine are also located in San Francisco.

Trade.—San Francisco contains the most compact market in the west, with 14,157 persons per square mile. Only New York city, Boston and Philadelphia exceed this density. The effective buying power of these people is the equivalent of 1,137,930 average Americans. The effective buying income per family in San Francisco amounts to \$3,360, compared with \$2,893 in California, \$2,788 on the Pacific coast and \$2,392 in the nation. The 1939 retail sales in San Francisco, reported by the U.S. census, amounted to \$382,554,000.

The wholesale sales are estimated at the tremendous sum of \$1,400,000,000. Sales at retail per capita amount to \$603, leading all other key cities of the coast. Sales at wholesale exceed those of any other coast city.

Transportation.—Converging in San Francisco are seven major transcontinental rail routes, 177 steamship lines, more than 30 truck lines, four transcontinental bus services, three transcontinental air transport routes and the famous transpacific Clipper fleet. Today, San Francisco is the terminus of four Class I railroads and a number of short lines. Since the San Francisco-Oakland Bay bridge was opened on Nov. 12, 1936, it has been crossed by nearly 45,000,000 vehicles. The Golden Gate bridge, open since May 1937, has been traversed by almost 15,000,000 vehicles.

San Marino, a small republic of 38 sq.mi. in the Apennines, S.W. of Rimini, entirely surrounded by Italian territory, is ruled by a grand council and two regents ("Capitani Reggenti") appointed therefrom to exercise executive powers. The population (Sept. 1939) was 14,545, giving a density of about 383 per square mile. The capital (of the same name) has about 2,000 inhabitants. All able-bodied male citizens between 16 and 55, except teachers and students, serve in the militia. Building stone and wine are exported; there is an electric railway to Rimini. Italian currency is in use, but there is a local silver coinage and a separate issue of postage stamps. The budget

estimate for 1939-40 balanced at 6,009,919 lire.

Sargent, Fred Wesley (1876-1940), president of the Chicago and North Western railroad company for 14 years, was born in Akron, Ia., May 26. He was educated at the University of South Dakota and the law school of Iowa State university. He was graduated from the law school in 1901 and began to practise in Sioux City. Five years later he was elected city attorney of Sioux City and re-elected in 1908. In 1920 he went to Chicago as general solicitor for the North Western. He served successively as general counsel and vice-president before being elected to the presidency of the company in 1925. He resigned because of ill-health in 1939. He died in Evanston, Ill., Feb. 4.

Saskatchewan, the middle of the three prairie provinces of Canada, was created a province by the dominion parliament Sept. 1, 1905. It has a total area of 251,700 sq.mi.; population 949,000 (estimate, Dominion Bureau of Statistics, 1939). The seat of government is Regina.

History.—The Liberal party, elected June 8, 1938, continued in power under the premiership of W. Patterson. There were no political happenings of special significance during 1940.

Economic.—The dollar value of the wheat crop (wheat growing is the first industry of the province) for the year 1940 was estimated at \$135,200,000 as compared with a similar figure for 1939. and in contrast to \$79,924,000 for 1938. Other grain crops were, in dollars: oats, \$18,050,000 (\$25,760,000, 1939); barley, \$5,520,000 (\$7,800,000, 1939); rye, \$1,775,000 (\$3,720,000, 1939); and flaxseed \$1,750,000 (\$1,680,000, 1939).

All field crops amounted to \$167,014,000 as compared with \$179,255,000 in 1939. Aggregate farm capital had in 1940 reached approximately \$1,000,000,000. Other main sources of income were: minerals, \$7,782,847; manufacturing, \$62,205,884; fisheries, \$486,646, as of 1938. These levels have been maintained since that time.

Savage, Michael Joseph (1872-1940), prime minister of New Zealand, was born in Benalla, Australia, March 7. He left school at the age of 14 and worked successively as a clerk in a store, as a labourer on a sheep ranch and as a miner. He was interested in the labour movement and in 1900 became secretary of the Political Labour council in Victoria and organized a co-operative store. He went to New Zealand in 1907 and became an active leader in the labour movement there. He was elected to the house of representatives in 1919 and succeeded to the leadership of the Labour party in 1933. In 1935 his party won the election and he became prime minister in the first labour government. The party increased its majority in the elections three years later and Mr. Savage continued in power. He died in Wellington, N.Z., March 26.

Savings Banks, Mutual. The year ending July 1, 1940 was another year favourable to the increase of assets and deposits in mutual savings banks in the United States. Total assets on July 1, 1940 were \$11,915,000,000, an increase of \$173,600,000 over July 1, 1939, as compared with

an increase of \$213,900,000 for the year ending July 1, 1939. Deposits credited to 15,756,823 accounts totalled \$10,589,000,000 on July 1, 1940, the highest amount ever recorded. The combined surplus was \$1,288,000,000, or 12.16% of total deposits. Dividends averaged 2.04% in 1940, a decline from 2.17% in 1939 and 2.50% in 1938. The total number of banks was reduced to 540, since during 1940 one bank was absorbed by a merger.

Investment policies of mutual savings banks did not change in 1940. The trend toward placing an increased amount of new investments in real estate mortgage loans continued. There were 146 savings banks that were "approved mortgagees" under the Federal Housing act. Loans insured under the Federal Housing act accounted for 17.6% of all the new mortgage loans made in 1939, and for 15.8% of all the new mortgage loans made in the first half of 1940. The policy of converting old mortgage loans to an amortized basis for repayment increased the total amount of funds available for investment and, in spite of the increased activity in new real estate mortgage loans, there remain surplus funds which, as formerly, are being invested in government bonds. More than 26% of total assets were invested in U.S. government direct and indirect obligations.

The second fiscal year of operation of insurance departments in New York state banks ended on Oct. 31, 1940, with eight issuing banks and ten agency banks engaged in the life insurance business, an increase of two issuing banks and three agency banks during the year. On that date there was \$11,101,723 of insurance in force, representing 13,700 policies, an increase of \$5,265,523 in insurance in force and of 6,694 policies since Oct. 31, 1939. In the state of Massachusetts there were 29 issuing banks and 106 agency banks on Oct. 31, 1940, an increase of three issuing banks and five agency banks during the year. In that state there was \$192,000,000 of insurance in force, representing 212,000 policies, an increase of \$19,000,000 in insurance in force and of 33,200 policies since Oct. 31, 1939.

After one year of operation, several changes were made in the New York statute governing savings bank life insurance, to conform with the views of savings banks. The changes were made to encourage more banks to enter the business. They were designed to place more responsibility on savings-insurance banks for the administration of the system than the original law permitted, without diminishing the supervisory functions of the state insurance and state banking departments, to which all the administration duties were at first also assigned. The amendment provided that contributions to the insurance guaranty funds could be made from the savings banks; whereas originally these funds were required to be subscribed by individuals.

If the mutual savings banks in the United States experienced few innovations in 1940, the savings banks in Europe had to meet changes that were catastrophic. No reports were available from the continent since April 1940, but the last figures received show the 1939 monthly deposits and withdrawals in savings banks in France, the Low Countries, Bulgaria and Greece. The outbreak of the war was followed by large withdrawals from savings banks in all these countries. In France the net loss in deposits for the month of Sept. 1939 was 1,654,000,000 francs, or 4% of total deposits. This trend was reversed in October, and by the end of the year more than half of this loss had been regained. There was a net gain for the entire year of 234,000,000 francs, which brought total deposits to 40,500,000,000 francs on Dec. 31, 1939, exclusive of interest credited for 1939. In Bulgaria and Greece also, the net losses realized in Sept. 1939 were followed by net gains in deposits for the balance of the year, but in Belgium, Holland and Denmark the net losses continued. For the year as a whole the savings banks in all of these five countries, except Bulgaria, had substantial net losses in deposits.

Balances in trustee savings banks of Great Britain amounted to £310,264,000 on Aug. 31, 1940, a gain of £22,467,000 for the year ending that date, as compared with a gain of £15,700,000 for the previous year. The old issue of national savings certificates, sold through post offices, savings banks and joint stock banks for the government, was replaced by a new issue at the beginning of the special war savings campaign in Nov. 1939. The issue permits the purchase of units of 15 shillings, which increase in value after five years to 17 shillings and sixpence, and after ten years to 20 shillings and sixpence. These certificates are free of income tax and may be cashed at any time. No individual may hold more than 500 savings certificates of any or all issues. A new security known as a defence bond was provided to attract more savings from the lower income groups for war expenses. Defence bonds bear 3% interest and may be purchased only in multiples of five pounds. They are repayable at par seven years from date of purchase at a premium of £1 per centum. Or they may be cashed for full value on six months' notice, or, in case of need, within a few days. Individual holdings of defence bonds are limited to £1,000. On Sept. 15, 1940 the special war savings campaign had raised £147,041,275 through the sale of national savings certificates, and £149,731,450 from the sale of defence bonds. Balances in post office and trustee savings banks had increased £63,077,000 since the beginning of the war savings campaign in Nov. 1939. (HE. BR.)

Schereschewsky, Joseph Williams (1873-1940), U.S. cancer expert, was born in Peking, China, March 6, and was taken to the United States in his infancy. He was graduated from Harvard college in 1895 and from the medical school of Dartmouth in 1899.

He was appointed an assistant surgeon in the United States Public Health service in November of the same year and was promoted through various grades until he became medical director in 1930. In 1922 he was put in charge of governmental investigations into the causes of cancer and established a research centre at the Harvard Medical school. In 1937 he organized a cancer control program for the state of Georgia. Among his other activities was the study of occupational diseases. In 1916 he was president of the American Association of Industrial Physicians and Surgeons. He died at West Harwich, Mass., July 9.

Scudder, Janet (1873-1940), U.S. sculptor and painter, was born in Terre Haute, Ind., Oct. 27. She studied art in Cincinnati, Chicago and in the Paris studio of Frederick MacMonnies. She won a medal for her work at the Columbian exposition in Chicago in 1893 and other medals at expositions in St. Louis, San Francisco, Amsterdam and Paris. She designed many fountains, notably the frog fountain in the Metropolitan Museum of Art in New York city. She was a chevalier of the Legion of Honour and an associate of the National academy. She died in Rockport, Mass., June 9.

Sculpture. The year 1940 was not productive of as spectacular opportunities as 1939 when government art patronage was at its highest stage. The two international expositions of that year put numerous exceptional projects within the reach of talented sculptors. But there was a definite surge of activity on the part of national and civic groups aimed at keeping vital the creative spirit in sculpture and encouraging public appreciation and support.

Museums were active in exhibiting sculpture and made also some notable acquisitions. Important competitions were promoted. A few prominent public memorials were projected or completed. Promotion of sculpture through exhibitions assumed its most important form in large scale activities such as the Sculpture Festival held by the National Sculpture society at the Whitney Museum of American Art. Consisting of the work of about 185 exhibitors, this exhibition was impressive in its illustration of the conservative aspects of contemporary sculpture, although considerable work by artists of the newer schools was included. Major events occurred also in the historical field.

Notable opportunities for study and appreciation of sculpture of the 18th and 19th centuries were afforded. Representing the earlier period was a distinguished exhibition of French sculpture from the M. David-Weill collection of Paris at the Wildenstein galleries, an exhibition rich in portraits and symbolical works by famous classicists, such as Houdon, Lemoyne, Pigalle, Coysevox and Pajou. These pieces, vastly prized by collectors of the past, served vividly to revive impressions of the courtly splendour and magnificence of the period they originally adorned. A later period was that represented by the 19th century *animalier*, Antoine Louis Barye, a comprehensive selection of whose bronzes was exhibited at the Metropolitan Museum of Art. The latter made the most of its notable collection to reaffirm the importance of Barye, especially in the field of dramatic animal interpretation.

But 1940's most sensational event was the showing, first in New York city and later in other cities throughout the U.S., of Jacob Epstein's controversial statue of "Adam," a seven-foot figure of massive pink alabaster symbolizing "primitive man." Epstein's work, which had created a furore in England, was sent to the U.S. for the purpose of raising funds to buy aeroplanes for

Great Britain. Exhibited with a group of portrait busts by the artist, it attracted the interest of the curious.

It appealed, however, less to those inclined to appraise the work purely as an object of art.

Museum acquisitions involved relatively few works of outstanding importance. The new National Gallery of Art in Washington, which soon opened to the public, obtained two historical fountains formerly ornamenting the 17th century Théâtre d'Eau, the open-air theatre built for Louis XIV at Versailles, France, and planned to use them to decorate the garden courts which were impressive architectural features of the gallery. Among the surviving elements of that theatre's decoration, they are considered excellent examples of the sculpture of the period. On the other hand contemporary sculpture was more prominent numerically, and among the largest groups was the gift of 36 pieces by Mrs. John D. Rockefeller, Jr., to the Museum of Modern Art in New York—including works by Maillol, Lehmbruck, Despiau, Modigliani, Lachaise and Zorach.

Lehmbruck's heroic "Standing Youth" was one of the most remarkable of these pieces.

The unveiling of Victore Salvatore's statue of James Fenimore Cooper, the novelist and author of the *Leatherstocking Tales*, at Cooperstown, N.Y., added to the monumental sculpture commemorating famous Americans which was placed throughout the U.S. during the year. Relatively few pieces achieved prominence, however, though several new projects were approved, including a statue of Paul Revere by Cyrus E. Dallin which was authorized for Boston by the trustees of the White fund. This bronze equestrian monument, when completed, will stand in a park near the Revere home.

Federal sponsorship of public sculpture was continued in 1940, though on a somewhat smaller scale than in the year before, with one of the major competitions held by the Section of Fine Arts involving the selection of two groups by a young artist, Robert Cronbach, for the new Social Security building in Washington. This artist was commissioned to complete in large scale bronzes statues submitted in model form on the subject of social security. The groups chosen were designed in semi-abstract style, one consisting of a worker symbolizing "Independence" and the other a mother and child group entitled "Shelter."

Europe.—In Europe sculptural achievement was necessarily greatly limited on account of the European war. Though definite attempts were made especially in France and Great Britain to preserve normal activity in the arts, intense preoccupation with the struggle in Britain, and the invasion of France prevented artists from carrying out their most important work.

From the continent in fact very little indicating the progress of sculptural work was forthcoming during 1940. (See also ART EXHIBITIONS.) (C. BU.)

Secondary Metals. The recovery of secondary metals in the United States and their return to industry for re-use has grown to such an extent that in many cases the yield is so large a proportion of the total consumption that the consuming industries would be seriously handicapped without access to this additional supply.

On the other hand, secondary recovery is viewed unfavourably by the primary producer, because it restricts the demand for new metal.

Very little information was available in 1940 on secondary recovery outside of the United States. No other country has developed it to the degree prevailing in the United States, but pressure

Seeing Eye, the corporate society that educates dogs to be the trusted guides and friends of blind men and women, had in 1940 the most successful year since its inception in 1928 when Morris Frank brought his German shepherd, Buddy I, from Mrs. Harrison Eustis's kennels in Switzerland. Bred for "character" and trained by Mrs. Eustis and Elliott S. Humphrey, the geneticist, Buddy I was the dog that proved Seeing Eye dogs could safely guide blind people through heavy American street traffic; and it is primarily due to her that in 1940, 537 dogs were leading their 537 blind owners from darkness and dependence into light and liberty. Mr. Frank works for the Seeing Eye with Buddy II, a handsome male dog, for his guide and friend; a new wing has been added to the headquarters at Morristown, N.J.; and 87 more dogs than in 1939 were active in 45 states, in the District of Columbia and in Canada.

Seeing Eye dogs are "attending college" as pilots to student masters; dogs are being guides in such diversified occupations as the law, teaching, undertaking, the ministry, journalism, electrical engineering, pharmacy, music and a great variety of mercantile pursuits, including selling insurance, hardware, groceries and raising poultry. In addition to supplying trained dogs for 537 blind persons mentally and physically capable of benefiting from a dog, the Seeing Eye makes notable progress in informing a sympathetic public of the Seeing Eye's need for financial support—each dog costs many times the amount paid by the blind purchaser. (B. TA.)

Seismology.

Seismology maintained progress in 1940 in many parts of the earth but suffered in the regions where war was going on. International machinery for dealing with the subject was seriously affected. Following the great earthquake of Dec. 27, 1939 in Turkey, strong shocks continued through Feb. 19, 1940. A strong earthquake in Rumania on Oct. 22 was followed by a great one on Nov. 10, with great property damage and loss of life. A destructive earthquake occurred in the Imperial Valley, Calif., on May 19. Moderate but widespread shocks in New Hampshire on Dec. 20 and 24 marked a renewal of activity in the New England area.

The strong-motion record of the Imperial Valley earthquake was analyzed by mechanical and mathematical methods, with resultant valuable information about the ground motions and information useful in the design of all types of structures, including dams, bridges, water towers and buildings. The same information was used to secure better simulation of earthquake in the motions of shaking platforms on which models of proposed structures are tested. Building construction codes were being improved as new information became available.

A new seismograph for recording nearby earthquakes was developed. Studies were made of the small tremors, not of seismic origin, known as microseisms. Attention was also given to the question whether earthquakes are caused by change of loading of the earth's crust due to large lakes behind dams.

Though earthquake prediction in time, place and maximum intensity remains impossible, no means was neglected of determining whether stress is growing at the earth's surface. Special attention was given to levelling, triangulation and tilt-measurement.

(N. H. H.)

Selective Service.

The year 1940 witnessed a drastic and significant change in U.S. national life. With the enactment of the Selective Training and Service Act of 1940, the United States implemented and integrated the greatest national defence program in its history. Early in 1940, congress inaugurated a national defence rearmament program involving the expenditure of more than \$15,000,000,000.

With the memory of U.S.A.'s unpreparedness in 1917 still fresh in their minds, the members of the 66th congress had passed the National Defence Act of 1920, which provided it was to be the duty "... of the war department general staff ... to prepare plans ... in conjunction with the naval forces ... for the mobilization of the manhood of the nation. . .". But in 1919 the selective service laws were allowed to lapse. The selective service organization was disbanded. From 1920 to 1926 the congressional mandate "to prepare plans" was fulfilled by occasional conferences between war and navy department officials. In 1926 these officials recognized the need for the assignment of qualified officers whose responsibility and function it would be to carry out the letter and the spirit of the law.

Joint Army and Navy Selective Service Committee.—After an interchange of letters between the secretary of war and the secretary of the navy, and on their recommendation, the Joint Army and Navy Selective Service committee was created on Jan. 22, 1926. The original committee comprised four officers: one from the marine corps and one from the bureau of navigation for the navy; and two from the army personnel division for the war department. Its first effort was to analyze and study the experiences of selective service during the war of 1914-18, in order to establish future policies and procedures that were tried and proved successful. It soon became apparent that the committee's greatest need was men; men capable of undertaking a long range program of study, research and planning.

Two major considerations argued that they should not be regu-

lar army, navy or marine corps officers.

First, a long range planning program could not be carried out by regular officers who usually receive a change of assignment every four years. Second, a military education or background was not essential, because the problems of procuring civilians for military service demanded rather a knowledge of civilians and a civilian background.

The secretaries of war and navy made an allotment of 95 reserve officers to assist the committee. These civilian reserve officers were to represent a cross section of U.S. national life. They were to be selected from all parts of the United States and were, in so far as it was possible, to represent varied fields of civilian endeavour.

After establishing broad general policies based on the study and research of previous experience, the committee then outlined a course of further study and research by, and education of, its assigned reserve officers through a series of correspondence courses. When these reserve officers had been indoctrinated in the policies and philosophies established by the committee and educated in the fundamentals of selective service, the committee began to formulate plans and regulations for the organization and operation of a nationwide man power procurement agency—the selective service system.

By 1935 policies and procedures were established; plans and

FIRST PAGE FROM NATIONAL MASTER LIST, first drawing, Oct. 29-30, 1940 under Selective Training and Service Act of 1940

regulations had been formulated, complete details for the organization, administration and operation of the national headquarters had been worked out. As a first step toward carrying out its planning, the adjutant general of the national guard in each state was asked to co-operate and work out details for the organization, administration and operation of selective service in his state. To assist in this work there were the trained reserve officers who were available for liaison and conference work.

By this time the original four-man committee had been increased by the addition of one reserve officer who had served with the selective service headquarters in the war of 1914-18, one national guard officer and two industrial advisers; one from the bureau of shore establishments for the navy and one from the office of the assistant secretary of war for the army. With the help of the committee and its assigned reserve officers, the state adjutants general and their staffs undertook the planning of the organization and operation of selective service in the various states, the District of Columbia, Hawaii and Puerto Rico. This work progressed through the years by means of summer training camps, weekly drill instruction periods, extension courses and conferences.

By 1936 over 100 officers, including national guard and naval liaison officers, were attending each of the four annual regional conferences. These conferences were of 14 days' duration and were held in different sections of the country so as to minimize travel time and expense. Nearly 7,000 extension course lessons were being completed annually by officers throughout the country.

When Major Lewis B. Hershey in July 1940 said that the Joint Army and Navy Selective Service committee was "ready," he said it in the full knowledge that the study and analysis of selective service of 1917 and the 14 years of subsequent study, research, planning and training guaranteed the success of any selective service program that was based on the committee's recommendations. The committee had worked out policies and procedures, rules and regulations and details of organization, administration and operation. Its allotment of 95 reserve officers was trained and ready, if called, to function as a national headquarters and as liaison officers with the various states. Each state had an adjutant general and a state staff, trained and ready, if called, to function as a state headquarters. Altogether there were about 350 officers of the army, navy and marine corps, the reserves and the national guard, who were trained specialists in selective service.

The congress of 1920 had told the war and navy departments "to prepare plans." By 1940, the plans had been prepared. The organization, machinery and details of operation outlined in the legislation before congress were identical with the plans of the committee. Said the United States senate: "Aye" by a vote of 47 to 25. Said the house of representatives: "Aye," 232 to 124. On Sept. 16, President Roosevelt signed the Selective Training and Service Act of 1940.

Selective Training and Service Act of 1940 (Condensed)

The purpose of the act is to provide for the common defence by increasing and training the armed forces under a fair and just system.

Excepting those already in military service, public health service, and aliens of certain recognized status, every male citizen and alien between the ages of 21 and 36 residing in the United States on the day or days fixed shall register.

Whether or not a state of war exists, the president may increase the forces from time to time as the national interest requires so long as there are never over 900,000 men in training and service in any one year under this act. The act will continue in effect for five years. And the president may induct no more men than the congress shall specifically appropriate for from time to time.

Physical examination by the military services shall be given the men upon induction and discharge.

Each man inducted shall serve 12 months, after which he will be placed in a reserve component for 10 years.

The same pay allowances, pensions, disability and death compensation provided for other enlisted men and officers of like grade and length of service are assured inductees under this act.

These inductees shall not be employed beyond the limits of the western

THE FIRST NUMBER—158—was drawn by Secretary of War Stimson in the U.S. draft lottery Oct. 29, 1940 at Washington, D.C. He is shown being blindfolded before picking the first capsule from the same "goldfish bowl" used in the 1917 draft. President Roosevelt is at the left

hemisphere except in the territories and possessions of the United States, including the Philippine islands.

Classification, selection and induction under the act shall be made in an impartial manner under such regulations as the president may prescribe.

The number of inductees shall be based on the state's proportion of eligible men compared to the total number of the nation's eligibles, except that credits shall be given for residents of each subdivision who are in the land and naval forces.

The act defers from training and service the following men in the armed forces: those who have served three consecutive years in the regular army; former national guardsmen and former reserve officers, under certain conditions; the vice-president, governors, members of state and federal legislatures, judges of courts of record.

No exception from registration or exemption or deferment from training and service under this act shall continue after the cause therefor ceases to exist.

Inductees leaving non-temporary positions with the federal government or private industry are protected by the act and are to be reinstated with no loss of seniority or privilege and may not be discharged without cause for at least one year after their return. The district courts of the United States are given jurisdiction in cases arising under this provision.

A personnel division is to be organized to secure re-employment and employment for men as they complete the training period.

No vacancy created by induction is to be filled by any member of the Communist party or the German-American bund.

The president is authorized to prescribe rules for deferments of: certain men whose occupation, or preparation therefor, is found necessary to national interest and also certain important office holders in the state and federal service; those physically, mentally or morally unfit for service; men with dependents; students entered during 1940 in recognized colleges until graduation or July 1, 1941, whichever occurs first.

Dependent when used in the act means one who is dependent in fact.

Recognized students and ministers of religion are not subject to military training, but must register. Non-combatant and non-military service is provided for conscientious objectors.

The president is empowered to place obligatory orders with any firm or individual for such defence materials as are required and which are of the nature usually produced or capable of being produced by such firm or individual. Upon refusal to comply authority is given to take immediate possession and such failure is deemed a felony which upon conviction carries a penalty of three years' imprisonment and a fine not exceeding \$50,000. Just compensation for materials and rent is assured.

The president is authorized: (1) to prescribe the necessary rules and regulations to carry out the provisions of this act; (2) to create and establish a Selective Service system, and shall provide for the classification of registrants and of persons who volunteer for induction under this act on the basis of availability for training and service, and shall establish within the Selective Service system civilian local boards and such other civilian agencies, including appeal boards and agencies of appeal, as may be necessary to carry out the provisions of this act. There shall be created one or more local boards in each county or political subdivision corresponding thereto of each state, territory and the District of Columbia. Each local board shall consist of three or more members to be appointed by the president, upon recommendations made by the respective governors or comparable executive officials. No member of any such local board shall be a member of the land or naval forces of the United States, but each member of any such local board shall be a civilian who is a citizen of the United States residing in the county or political subdivision corresponding thereto in which such local board has jurisdiction under rules and regulations prescribed by the president. Such local boards, under rules and regulations prescribed by the president, shall have power within their respective jurisdictions to hear and determine, subject to the right of appeal to the appeal boards herein authorized, all questions or claims with respect to inclusion for, or exemption or deferment from, training and service under this act of all individuals within the jurisdiction of such local boards. The decisions of such local boards shall be final except where an appeal is authorized in accordance with such rules and regulations as the president may prescribe. Appeal boards and agencies of appeal within the Selective Service system shall be composed of civilians who are citizens of the United States. No person who is an officer, member, agent or employee of the Selective Service system, or of any such local or appeal board or other agency, shall be excepted from registration, or deferred from training and service, as provided for in this act, by reason of his status as such officer, member, agent or employee; (3) to appoint by and with the advice and consent of the

ARMY BARRACKS for a complete division were speeded up in 1940 at Fort Dix, N.J., to house the new conscripts and volunteers

senate, and fix the compensation at a rate not in excess of \$10,000 per annum, of a director of selective service who shall be directly responsible to him and to appoint and fix the compensation of such other officers, agents and employees as he may deem necessary to carry out the provisions of this act; *provided*, that any officer on the active or retired list of the army, navy, marine corps or coast guard, or of any reserve component thereof or any officer or employee of any department or agency of the United States who may be assigned or detailed to any office or position to carry out the provisions of this act (except to offices or positions on local boards, appeal boards, or agencies of appeal) may serve in and perform the functions of such office or position without loss of or prejudice to his status as such officer in the army, navy, marine corps, or coast guard or reserve component thereof, or as such officer or employee in any department or agency of the United States: *provided further*, that any person so appointed, assigned or detailed to a position the compensation in respect of which is at a rate in excess of \$5,000 per annum shall be appointed, assigned, or detailed by and with the advice and consent of the senate: *provided further*, that the president may appoint necessary clerical and stenographic employees for local boards and fix their compensation without regard to the Classification Act of 1923, as amended, and without regard to the provisions of civil service laws; (4) to utilize the services of any or all departments and any and all officers or agents of the United States and to accept the services of all officers and agents of the several states, territories and the District of Columbia and subdivisions thereof in the execution of this act; and (5) to purchase such printing, binding and blank-book work from public, commercial, or private printing establishments or binderies upon orders placed by the public printer or upon waivers issued in accordance with section 12 of the Printing act approved January 12, 1895, as amended by the Act of July 8, 1935 (49 Stat. 475), and to obtain by purchase, loan, or gift such equipment and supplies for the Selective Service system as he may deem necessary to carry out the provisions of this act, with or without advertising or formal contract; and (6) to prescribe eligibility, rules and regulations governing the parole for service in the land or naval forces, or for any other special service established pursuant to this act, of any person convicted of a violation of any of the provisions of this act.

The president is further authorized to delegate any authority vested in him under this act to such officers, agents or persons as he may designate. Voluntary services may be accepted.

The chief of finance, United States army, is designated as fiscal, disbursing and accounting agent for selective service.

Any person charged with the duty of carrying out any of the provisions of this act, or the rules or regulations made or directions given thereunder, who shall knowingly fail or neglect to perform such duty, and any person charged with such duty, or having and exercising any authority under said act, rules, regulations or directions who shall knowingly make, or be a party to the making, of any false, improper or incorrect registration, classification, physical or mental examination, deferment, induction, enrollment or muster, and any person who shall knowingly make, or be a party to the making of, any false statement or certificate as to the fitness or unfitness or liability or non-liability of himself or any other person for service under the provisions of this act, or rules, regulations or directions made pursuant thereto, or who otherwise evades registration or service in the land or naval forces or any of the requirements of this act, or who knowingly counsels, aids or abets another to evade registration or service in the land or naval forces or any of the requirements of this act, or of said rules, regulations or directions, or who in any manner shall knowingly fail or neglect to perform any duty required of him under or in the execution of this act, or rules or regulations made pursuant to this act, or any person or persons who shall knowingly hinder or interfere in any way by force or violence with the administration of this act or the rules or regulations made pursuant thereto, or conspire to do so, shall, upon conviction in the district court of the United States having jurisdiction thereof, be punished by imprisonment for not more than five years or a fine of not more than \$10,000, or by both such fine and imprisonment, or if subject to military or naval law may be tried by court martial, and, on conviction, shall suffer such punishment as a court martial may direct. No person shall be tried by any military or naval court martial in any case arising under this act unless such person has been actually inducted for the training and service prescribed under this act or unless he is subject to trial by court martial under laws in force prior to the enactment of this act. Precedence shall be given by courts to the trial of cases arising under this act.

The monthly base pay of enlisted men of the army and marine corps shall be as follows: enlisted men of the first grade, \$126; enlisted men of the second grade, \$84; enlisted men of the third grade, \$72; enlisted men of the fourth grade, \$60; enlisted men of the fifth grade, \$54; enlisted men of the sixth grade, \$36; enlisted men of the seventh grade, \$30; except that the monthly base pay of enlisted men with less than four months' service during their first enlistment period and of enlisted men of the seventh grade whose inefficiency or other unfitness has been determined under regulations prescribed by the secretary of war, and the secretary of the navy, respectively, shall be \$21. The pay for specialists' ratings, which shall be in addition to monthly base pay, shall be as follows: first class, \$30; second class, \$25; third class, \$20; fourth class, \$15; fifth class, \$6; sixth class, \$3. Enlisted men of the army and the marine corps shall receive, as a permanent addition to their pay, an increase of 10 per centum of their base pay and pay for specialists' ratings upon completion of the first four years of service, and an additional increase of 4 per centum of such base pay and pay for specialists' ratings for each four years of service thereafter, but the total of such increases shall not exceed 25 per centum. Enlisted men of the navy shall be entitled to receive at least the same pay and allowances as are provided for enlisted men in similar grades in the army and marine corps.

When used in this act the United States refers to the several states, the District of Columbia, Alaska, Hawaii and Puerto Rico.

Registration Day for Selective Service.—In accordance with the provisions of the act, President Roosevelt appointed Clarence Addison Dykstra, president of the University of Wisconsin, as the director of selective service, at a salary of \$10,000 a year and proclaimed Oct. 16, 1940 as registration day for the continental United States. Proclamations set registration day on Oct. 26 for Hawaii, Nov. 20 for Puerto Rico and Jan. 22, 1941 for Alaska.

In accordance with the prearranged plan of the Joint Army and Navy Selective Service committee, the governors of the several states and the adjutants general and state staffs immediately undertook to set up the registration machinery. Federal, state and municipal employees—in some cases—city and state-wide organizations, such as police departments and school systems, were called into service. Polling places, schoolhouses, police stations and the like, were set up and organized as registration places. Day and evening classes were organized to instruct volunteer registrars in their duties and responsibilities.

On Oct. 16, 1940 more than 1,000,000 American men and women voluntarily served as registrars in more than 125,000 registration places throughout the U.S.A. Between 7.00 A.M. and 9.00 P.M. more than 16,000,000 men were registered in the continental United States.

Selective Service System.—While the preparations for registration day were being made, President Roosevelt issued an executive order which created the Selective Service system. The Joint Army and Navy Selective Service committee and a number of its assigned reserve officers became the nucleus of the national headquarters of the Selective Service system. The adjutants general and their staffs in the various states became the nucleus of the state headquarters. Each governor was asked to nominate a state selective service director for appointment by the president. This state director was to be the operating head of the Selective Service organization in each state. The governors were also asked to nominate those who were to be appointed by the president as members of local boards, appeal boards, examining physicians and government appeal agents.

Speedily and efficiently the entire nationwide Selective Service system was organized and implemented. The outstanding characteristic of the Selective Service system was the almost complete decentralization of its organization and operation. Director Dykstra and a trained and experienced staff comprised the national headquarters. The main function of the national headquarters was to direct and co-ordinate the activities of the various state headquarters.

The state director and a trained and experienced staff comprised each state headquarters. The main function of these state headquarters was to direct and co-ordinate the activities of the local boards, advisory boards, appeal boards, examining physicians, government appeal agents and medical advisory boards in their respective states.

In each state a local board was created for each county, except where there were more than 30,000 people in a county, in which case additional boards were created, so that there was one local board to serve each 30,000 people. These local boards were comprised of not less than three members. Attached to each local board were one or more examining physicians and one government appeal agent. A total of 6,256 local boards were created to serve continental United States, together with 25 for Hawaii and 122 for Puerto Rico. In these local boards rested the real administrative and functional responsibility in the selective service system. Each local board was responsible for the classification and resultant deferment or induction of the registered men in its local board area.

The examining physicians made the physical examinations and reported their recommendations to the local board as to the physical fitness of registrants. The government appeal agent assisted registrants and advised them regarding appeals and protected the government by appealing any local board classification not in the best interests of the government.

*Registration date in Hawaii set by presidential proclamation for Oct. 26, 1940.
†Registration date in Puerto Rico set by presidential proclamation for Nov. 20, 1940.
‡Registration date in Alaska set by presidential proclamation for Jan. 22, 1941.
§Final results are not available in time for this publication; however, the Bureau of the Census estimate for Alaska is 8,500.

In each state, boards of appeal were created; one for each 70,000 registrants. These boards of appeal were comprised of not less than five members representative of the various elements and activities in their area. They included one member from labour, one from industry, one physician, one lawyer and where applicable, one member from agriculture. A total of 280 boards of appeal were created to serve the continental United States, together with 1 for Hawaii and 1 for Puerto Rico. These boards of appeal had jurisdiction to review any decision concerning the classification of a registrant by any local board after an appeal had been filed with the local board. They might affirm, modify or reverse the decision of the local board. The decision of the board of appeal was final, unless modified or reversed by the president of the United States.

In each state, the governor created advisory boards for registrants. These boards usually comprised three or more lawyers. Their function was to advise and assist registrants. The governors also created medical advisory boards usually consisting of internists; eye, ear, nose and throat specialists; orthopaedists; surgeons; psychiatrists; clinical pathologists; radiographers; and dentists. These boards assisted the local boards to decide questions of a

registrant's physical fitness when the local examining physician was in doubt.

Members of the advisory boards, appeal boards and local boards, together with the examining physicians and government appeal agents were all voluntary workers. They served their country without compensation. They numbered almost 200,000.

After Registration Day.—The day following registration day the registrars sent the registration cards which had been entrusted to them to the local board nearest each registrant's home address. Each local board then began the process of sorting and numbering its cards. After examining the cards to ensure that all belonged to men in its local board area, each local board shuffled its cards and then gave each card a serial number. The first card received serial number 1; the second card, serial number 2; the third card, serial number 3 and so on. When the serial numbering process had been completed, each of the more than 16,000,000 men who were registered, had been assigned a serial number.

*There are a total of approximately 18,000 examining physicians throughout the U.S.A. However, there is no point in making State by State breakdown of this figure because it continually changes due to the addition of temporary examining physicians from time to time to meet changing demand for this type of service. Registrants' Advisory Boards are in the same category, being appointed as circumstances demand.
†Approximately.

Each local board then prepared a "List of Registrants." At the top of the list was serial number 1 and the name of the man whose card received serial number 1, next was serial number 2 and the name of the man whose card received serial number 2, and so on. The local board next posted its list of serial numbers and names for public inspection in or near the local board. A copy was sent to state headquarters and copies were made available for the press and radio news agencies.

In each local board area there was a man who held serial number 1; another, serial number 2; and so on up to a serial number equal to the number of men registered in the particular board. A local board with 125 registrants had serial numbers from 1 to 125; one with 6,125 registrants had serial numbers from 1 to 6,125.

National Selective Service Lottery.—While this process of serial numbering was nearing completion, Director Dykstra announced that the National Selective Service lottery would be held on Oct. 29, 1940. There were 9,000 opaque capsules filled with individual cardboard slips, bearing the numbers 1 to 9,000. The goldfish bowl which was used in the draft lottery of 1917 was loaned by Independence Hall, Philadelphia, where it was on display. Colonel Charles R. Morris, who arranged the 1917 lottery, and blindfolded Secretary Newton D. Baker for the drawing in the war of 1914-18, was invited to Washington to help with the arrangements. Through the co-operation of Administrator John M. Carmody of the Federal Works agency, the departmental auditorium on Constitution avenue in Washington, D.C., was made ready for this historic event.

Telegraph, telephone and teletype lines were installed; lines from all the radio networks were carried into the building; platform and stands were erected for movie, news reel and news photo cameramen. At 10.30 on the morning of the lottery, the 9,000 capsules containing the numbers were brought to the auditorium from the treasury department vault where they had been under guard to avoid tampering or loss. Before the assembled news men, radio men, cameramen and Washington officials, the capsules were poured and stirred into the historic goldfish bowl which stood on a table at the front of the stage.

Long before noon, the huge auditorium was packed with government officials, diplomats and spectators. A few minutes before 12, President Roosevelt's car stopped in front of the auditorium where a guard of honour of American war veterans had massed the colours. The president's car turned into the driveway and at high noon the chief executive appeared on the stage of the auditorium, surrounded by members of his cabinet and high ranking army and navy officials. Director Dykstra stepped to the microphone and said simply: "Ladies and gentlemen, the president of the United States."

Said the president: "... only the strong may continue to live in freedom and peace. . . . In the considered opinion of the congress of the United States, this Selective Service provides the most democratic as well as the most efficient means for mustering our manpower." Immediately following the president's address, Secretary of War Stimson stepped forward to the capsule-filled goldfish bowl and was blindfolded by Colonel Charles R. Morris. Digging deeply into the bowl, Secretary Stimson drew forth a capsule. It was opened and the cardboard slip was given to the president. The president announced: "The first number drawn in the Selective Service lottery is 158."

By telegraph, telephone and radio the number was flashed to every corner of the country in a matter of seconds.

Secretary of the Treasury Morgenthau drew the second number, which was 192; Attorney-General Jackson, the third, 8,239; Secretary of Navy Knox, the fourth, 6,620; Federal Loan Administrator Jesse Jones, the fifth, 6,685. After Jesse Jones had drawn

the fifth number, the president left the auditorium and the drawing continued in the mechanical routine manner for 17 hr.

Every precaution was taken by selective service officials to minimize the chance of error and to assure the U.S.A. that no possible mistake would pass by unnoticed. The capsules were completely opaque and of sufficient length to make it unnecessary to fold the numbered slips. Each number, as it was drawn, was read aloud. The numbered slip was then photographed with a watch which showed the second, minute and hour of the drawing. This photograph also recorded the sequence or order in which the number was drawn. The numbered slip was then mounted with adhesive on a master sheet which held 250 numbers in the order of drawing. As each sheet was filled, it was photographed and rushed to the government printing office. There the sheet was reproduced by a photo offset process and the true photographic copy was sent to each local board. By this method, confusion resulting from error in typesetting was completely eliminated.

The tension of the audience eased as the "guest pickers" gave way to trained teams of government employees who did the bulk of the drawing. Numbers were drawn at a fast, steady pace—12 per minute, or roughly 700 an hour (500 was the average rate). Throughout the night the process continued. Numbers became as much a singsong as the feet of marching men.

Drawing and tabulating the 9,000 numbers was an exhausting task. Clerical employees worked in shifts, on duty for two hours, resting for four hours. Army cots were provided in the basement. At last, at 5.47 A.M., Brig. General Lewis B. Hershey, deputy director of Selective Service, drew the last capsule (no. 2,114) from the glass jar. The entire procedure had required 17 hr., 31 min.

After the Lottery.—The 9,000 numbers that had been put into the bowl had, as a result of the lottery, been rearranged in an accidental sequence known as the national master list. This national master list was sent to every state headquarters and local board throughout the country.

Upon receiving the national master list, the local board proceeded to give each registrant an order number. The greatest care was exercised in the assignment of these order numbers, because the order numbers established the order in which registrants were to be selected for service.

The registrant whose serial number appeared at the top or nearest the top of the national master list, received order number 1. The registrant whose serial number was next closest to the top, received order number 2. The registrant whose serial number was third closest to the top of the list, received order number 3, etc., until each registrant had an order number.

Order numbers were assigned in sequence; no order numbers were skipped. Serial numbers appearing on the national master list which were not held by any registrant of a particular local board, were simply crossed off the national master list and ignored.

The first step in the process of order numbering was the elimination of those serial numbers on the national master list which did not apply to the particular local board. The remaining serial numbers on the national master list were then paired with the proper order number.

For example, the national master list began:

Serial number	158
serial number	192
serial number	8,239
serial number	6,620
serial number	6,685
serial number	4,779

These were the first 6 serial numbers drawn in the lottery, arranged in the order in which they were drawn. Suppose that a certain local board's largest serial number was 4,780, because only 4,780 men were registered in that particular local board area. Thus: serial number 158 got order number 1; serial number 192 got order number 2; serial number 8,239 (eliminated); serial number 6,620 (eliminated); serial number 6,685 (eliminated); serial number 4,779 got order number 3.

When the local board was sure that its assignment of order numbers was correct, it entered the order numbers on the registration cards in red ink in the place designated. Thus, when this order numbering process had been completed, the more than 16,000,000 registrants in more than 6,400 local boards had been arranged in a new and accidental sequence that determined the order in which each man would be considered for service by his local board. (See also under various states.)

Classification.—Beginning with the man holding order number 1, and following the numerical sequence of order numbers, the local board then began to mail questionnaires to its registrants at the rate of not more than 50 each day. Five days were allowed for the return of this questionnaire to the local board. On the basis of the information contained in the questionnaire, the local board then began to classify each man in one of the following classes:

Class I-A: Available; Fit for general military service. In class I-A are placed registrants who, after physical examination, are found fit for general military service.

Class I-B: Available; Fit only for limited military service. In Class I-B are placed registrants who, after physical examination, are found fit for only limited military service.

Class I-C: Available; Member of land or naval forces of the U.S. In Class I-C are placed registrants who are or who by induction or enlistment become a member of our land or naval forces.

Class I-D: Student fit for general military service. Available not later than July 1, 1941. In Class I-D are placed college or university students who, after physical examination, are found fit for general military service.

Class I-E: Student fit for only limited military service. Available after July 1, 1941. In Class I-E are placed college or university students who, after physical examination, are found fit only for limited military service.

Classification in Class I-A, I-B, I-D, or I-E is made only after examination by the local board's examining physician.

Class II-A: Man necessary in his civilian activity. In Class II-A are placed registrants found to be necessary men in industry, business, employment, agricultural pursuits, government service, or any other service or endeavour or in training or preparation therefor, the maintenance of which is necessary to the national health, safety or interest in the sense that it is useful or productive and contributes to the employment or well being of the community or the nation.

Class III-A: Man with dependents. In Class III-A are placed registrants upon whom one or more dependents rely for support in a reasonable manner.

Class IV-A: Man who has completed service. In Class IV-A are placed registrants who have completed the required military service.

Class IV-B: Official, deferred by law. In Class IV-B are placed registrants who are officials, specifically deferred by law.

Class IV-C: Nondeclarant alien. In Class IV-C are placed registrants who are aliens and who have not declared their intention to become citizens of the United States.

Class IV-D: Minister of religion or divinity student. In Class IV-D are placed registrants who are regular or duly ordained ministers of religion or who are students who are preparing for the ministry in the theological or divinity schools, recognized as such, for more than one year prior to the date of the enactment of the Selective Service act.

Class IV-E: Conscientious objectors. In Class IV-E are placed conscientious objectors who are available only for civilian work of national importance.

Class IV-F: Physically, mentally or morally unfit. In Class IV-F are placed registrants who are found to be physically, mentally or morally unfit for military service; habitual criminals, or persons convicted of treason, or any crime which under the laws of the jurisdiction in which they were convicted, is a felony and under which the local board determines the registrant morally unfit for service.

Registrants who claim to be conscientious objectors had to substantiate their claims in a special form of questionnaire. In the case of registrants claiming to be conscientious objectors, the local board proceeded in the ordinary course to classify them upon all other grounds of deferment and had to investigate and pass upon their claim as a conscientious objector only if, after physical examination, except for their claim of conscientious objection, they would be placed in Class I-A, I-B, I-D or I-E.

If the local board found that the registrant who was placed, after physical examination, in Class I-A, I-B, I-D or I-E, and who claimed to be a conscientious objector, was by reason of his religious training and belief conscientiously opposed to combatant service in which he might be ordered to take human life, but was not conscientiously opposed to noncombatant service in which he could contribute to the health, comfort and preservation of others, the local board determined that the registrant was available for noncombatant service only. The local board indicated this by

placing an "O" after the letter indicating his subclass. For example: Class I-A-O, or I-B-O.

If the local board found that a registrant who, but for his conscientious objection to both combatant and noncombatant service would have been placed in Class I-A, I-B, I-D or I-E, was by reason of his religious training and belief opposed to both combatant and noncombatant service, he was placed in Class IV-E. Registrants in Class IV-E were liable for service in work of national importance under civilian direction only.

Induction.—As a result of the classification process, each local board had a pool of men classified in class I-A (fit for general military service). Early in Nov. 1940, the war department issued its first call for men to be inducted through the selective service process. The total number of men inducted in the first call was 19,670. This call was apportioned among the states, and the State Selective Service headquarters, in turn, apportioned its quota among its various local boards.

Men were supplied to fill the first selective service induction as shown in Table IV.

Quotas.—The figures in Table IV represented the total inductions during the year 1940 under the Selective Training and Service Act. They were the first of the 800,000 men who would be inducted by selective service by July 1, 1941. The calls issued to the various states were based on estimates.

Subsequent adjustments were to be made in order to conform to that provision of the Selective Training and Service act which provided:

"Quotas of men to be inducted for training and service under this act shall be determined for each state, territory, and the District of Columbia and for subdivisions thereof . . . on the basis of the actual number of men . . . who are liable for such training and service, but who are not deferred after classification, except that credits shall be given in figuring such quotas for residents of such subdivisions who are in the land and naval forces of the United States. . ."

In figuring these tentative preliminary quotas that were used for the initial induction, estimates were made as shown in Table V. The gross quota represents an estimate of the total number of men who would be in U.S. armed forces on July 1, 1941, from the particular state, based on the number of men available for service from that same state. The credits (national guard) represents the total number of men who will be in the national guard on July 1, 1941, from the particular state to which they are credited. The credits (other) represents an estimate of the total number of men who will be in other branches of the armed forces on July 1, 1941, from the particular state to which they are credited. The net quota

From *Voting in the United States*, The Council of State Governments (Aug. 1940). Information on voting by persons in military service was compiled by the Legislative Reference Section of the Library of Congress.

represents gross quota less the credits. This net quota is the estimated number of men to be inducted by selective service in order to make up the number of men to be supplied by the particular state. (C. A. Dy.)

Medical Aspects.—Through co-operation between the selective service organization and the army medical corps a uniform type of physical examination was developed and uniform standards were applied by the physicians of the selective service boards and those who constituted the induction boards. Those examined were classified into groups: (1) those selected for general service; (2) those selected for special and limited military service and (3) those who, because of physical defects, were unacceptable for any class of military service. A complete record was kept of every man examined on which all minor as well as major defects which might disqualify him were recorded. After the registrant filled out a questionnaire he was examined as to height, weight and chest measurement. Standards and minimum acceptable measurements of height, weight and circumference of the chest are shown in Table VII.

Table VII.—Mobilization Physical Examination Standards

Height	Standard		Minimum	
	Weight	Chest measurement at expiration	Weight	Chest measurement at expiration
Inches	Pounds	Inches	Pounds	Inches
60	116	31 $\frac{3}{4}$	105	28 $\frac{3}{4}$
61	110	31 $\frac{1}{2}$	107	29
62	122	31 $\frac{1}{2}$	109	29 $\frac{1}{4}$
63	125	32	111	29 $\frac{1}{2}$
64	128	32 $\frac{1}{4}$	113	29 $\frac{3}{4}$
65	132	32 $\frac{1}{2}$	115	30
66	136	32 $\frac{3}{4}$	117	30 $\frac{1}{4}$
67	140	33	121	30 $\frac{1}{2}$
68	144	33 $\frac{1}{4}$	125	30 $\frac{3}{4}$
69	148	33 $\frac{1}{2}$	129	31

71	156	34	137	31 $\frac{1}{2}$
72	160	34 $\frac{1}{4}$	141	31 $\frac{3}{4}$
73	164	34 $\frac{1}{2}$	145	32
74	168	34 $\frac{3}{4}$	149	32 $\frac{1}{4}$
75	172	35	153	32 $\frac{1}{2}$
76	176	35 $\frac{1}{4}$	157	32 $\frac{3}{4}$
77	180	35 $\frac{1}{2}$	161	33
78	184	35 $\frac{3}{4}$	165	33 $\frac{1}{4}$

Anyone who fell within these standards was considered suitable for general military service, even one whose weight was greater than the standard indicated for the height, provided the overweight was not sufficient to interfere with military training. The mere fact that a man was overweight would not in itself bar him from military service. Such a man might be accepted for limited or special service, provided he was not otherwise mentally or physically unfit.

The examining board was given much discretion in matters of weight and height. If in its opinion proper food and physical training would make a man acceptable for service, he was likely to be inducted. All of the various standards from a physical point of view were included in the official bulletin which could be secured from the selective service board or from the United States army medical department.

Particularly important in the new regulations was the requirement that a test for syphilis be made on each man examined and that on those positive, another test should be made. Two positive Wassermann tests disqualified a man for military service. This was the first time in the history of any army that such a regulation had been put into effect.

The first official statistics came from 120 local examining boards in New York city and covered 1,643 men. Of these 1,213 were accepted for general military service, leaving 430 rejected or fit for limited duty only. The causes for rejections included 2.7% of the total men examined rejected for underweight or for overweight; two men were rejected for deficient height; several were rejected for deformities of the head and of the spine. Defective vision was the primary cause of rejection of 5%, or 74 men; 1.4%, or 19 men, had ear troubles; .9% had nose and throat troubles. As is usual, teeth and mouth conditions caused more rejections than any other single cause—namely, 5.7% of the total. Of the men examined 4.9 percent were rejected for heart diseases. As a probable result of infantile paralysis 28 men were rejected, or 1.7% of the total, which was a reflection of the infantile paralysis epidemic in New York of 1916. Foot and leg conditions caused 3.3% rejections and 1% were rejected for tuberculosis. Only 6 men, .4% of the total, were rejected because of syphilis but there were 90 cases of a positive Wassermann test which deferred the men in question until they could be re-examined. Psychiatric problems represented .8% of the total and led to the deferment of 12 mental defectives and one man for nervous instability.

These figures do not indicate that the U.S. is a nation physically unfit. A large proportion of the rejections were for ailments that are minor and easily remediable. In 1917-18 about 10% of the draftees were rejected because of manifest tuberculosis. The mortality from that disease declined 75% in the last quarter century among men of draft ages. The reduction in heart disease mortality among men of these ages was about 40% for white men and 60% for Negroes. The figures developed by the National Institute of Health indicated that altogether 60% of all disabilities would be due to defects of the eye and ear, mechanical defects and conditions of the heart and kidneys. It was estimated that about 140,000 men would be rejected because of tuberculosis.

When the men were sent from the selective service boards to the induction boards, another 25% were rejected. Out of 415 men examined, 315 were found fit for service and 100 were rejected. Even though these men had been passed on by the selective service board, teeth and eyesight in some were still found not to be up to army standards.

Especially important was the difficulty of combing out those who were defective from a mental point of view. In Jan. 1941 a conference was called in Washington by the Federal Security administrator to establish definite standards for the examinations in the field of psychiatry and to do everything that could possibly be done to eliminate cases of potential nervous breakdown among the men selected for military service. (M. Fr.)

Selenium. The bulk of the selenium output of the world is a by-product in copper refining in the United States and Canada; Sweden, the soviet union, Mexico and Japan have some production, but no statistics are available. Production in the United States amounted to 227,100 lb. in 1939, with imports of 124,800 lb. Production in Canada declined to 367,900 lb. in 1939. The chief use is in the glass industry as a decolorizer and as the coloring agent for red or ruby glass; other uses are in pigments, rubber vulcanization and flame-proofing; one of the most promising of the newer uses is the addition of selenium to copper alloys and steels to improve the machinability. Shanks, David Carey (1861-1940), U.S. soldier, was born in Salem, Va., April 6. He was graduated from the United States Military academy at West Point in 1884. He rose through various grades until he reached the rank of major general in 1917, and was retired in 1925. He served in the Spanish-American war and in the Philippines and was inspector general of the army in the Philippines in 1917 when the United States entered the World War. He was called

home and put in charge of the embarkation of troops and did his work so well that he received the Distinguished Service medal. He died in Washington, D.C., April 10.

Sheep. The 1940 lamb crop in the United States broke all production records, 32,729,000 head, which was 2% over the previous high of 32,157,000 in 1938, about 3% over the 1939 crop of 31,781,000 lambs and 9% over the ten-year (1929-38) average. The percentage of lambs saved per 100 ewes was 87.5%, compared to 86.3% in 1939 and 88.7% the previous peak year, 1938. The number of breeding ewes more than one year old was 7,395,000 at the beginning of 1940, and 36,824,000 in 1939.

Production of Lambs in the United States, 1940 and 1939

	1940	1939
13 range states		
Texas	4,867,000	4,030,000
California	2,474,000	2,630,000
Wyoming	2,292,000	2,335,000
Montana	2,019,000	1,927,000
Utah	1,594,000	1,573,000
Idaho	1,546,000	1,580,000
Oregon	1,453,000	1,513,000
New Mexico	1,309,000	1,320,000
Colorado	1,361,000	1,347,000
South Dakota	1,040,000	957,000
Nevada	564,000	537,000
Washington	546,000	570,000
Arizona	470,000	480,000
11 North Central States	7,924,000	7,732,000
24 Atlantic and South Central States	3,192,000	3,241,000

A pronounced shift in the number of sheep in the different states between 1934 and 1940 was reported in the *National Wool Growers' Journal* of Salt Lake City, Utah, in its Sept. 1940 issue. In that time the number of sheep in California increased 23.5%, and in Texas 22%. Eleven range states, long a stronghold of the sheep industry, decreased by 13%. These states were: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, North Dakota, Oregon, Utah, Washington and Wyoming. The decline, the *National Wool Growers' Journal* pointed out, was owing partly to a reduction in government grazing permits, but largely because it was more profitable to grow lambs in Texas and California and in 14 farm states where the number of sheep had increased 11.66%. The 14 farm states were: Alabama, Arkansas, Illinois, Iowa, Kansas, Kentucky, Louisiana, Michigan, Minnesota, Missouri, Nebraska, Oklahoma, South Dakota and Tennessee. In 21 other states the number of sheep declined 8.16%. The sheep industry in 1940 became an object of special wartime interest as the U.S. army and navy munitions board specified wool as a "critical material." On Oct. 10, 1940 the National Defence Advisory commission announced that it had arranged for 250,000,000 grease lb. of British-owned Australian wool to be stored in the United States as a strategic reserve. This reserve, it was announced, had not been purchased. It was to be available, without dislocation of domestic wool markets, only as need might arise. (See also LIVESTOCK; MEAT.)

(S. O. R.)

Shipbuilding. There are no authentic reports as to world tonnage of commercial shipping built or building during 1940. Merchant tonnage of seagoing vessels under construction in the United States as of Dec. 1 was about 1,529,570 gross tons, to which should be added about 62,000 tons of miscellaneous small craft. United States tonnage delivered during 1940 was about 408,000 tons. Reports indicate that the British output of commercial tonnage for 1940 was in excess of 1,000,000 tons. So far as other European shipyards were concerned it is believed that the output of commercial tonnage was very small and that the efforts of the axis powers were devoted largely to the construction of naval vessels. The output for Japan was assumed to be about the same as for 1939. Monthly reports of tonnage losses from all causes due to the war, plus normal casualties from grounding or weather showed a total loss for all nations of about 4,500,000 gross tons. The net loss of world tonnage, therefore, since the war, was about 3%.

United States.—The demand by Great Britain for commercial vessels was very great, either for existing tonnage or for new construction. Late in December it was announced that a contract had been placed in the United States for the construction of 60 merchant vessels of about 10,000 deadweight tons each for British account, 30 of these vessels to be built on the east coast and 30 on the west coast.

In the United States the increased demand for tonnage to take over the interrupted trade of belligerent nations and to care for its own trade previously handled in foreign vessels, together with the sale of many of the older vessels to foreign governments created a continued demand for new U.S. tonnage, so that the activities of U.S. shipyards in the construction of commercial vessels was greater than at any previous period in peacetime.

The program of the maritime commission since its inception late in 1937 consisted of 179 vessels, of which 83 had been launched and 56 had been delivered to Dec. 18, 1940. One hundred and thirty-seven of these vessels are propelled by steam and 42 by internal combustion engines. The maritime commission's program of 50 commercial seagoing vessels a year for a period of 10 years has so far been considerably exceeded and it seems probable that it will be exceeded for some time to come.

In 1939 it was anticipated that private shipyards in the United States then operating would be able with existing facilities or moderate extensions thereof to handle any merchant or naval program then in sight. Since that time two acts of congress, one on June 14, 1940, providing for an 11% naval increase and a second on July 19, 1940 providing for a further naval increase of 70%, required large extensions of shipbuilding facilities in both navy yards and private shipyards, and brought into being new shipyards for the construction of naval vessels, so that the demand upon the industry in 1940 was greater than at any time in the past with the possible exception of the World War (1914-18) period.

VIEW OF THE "AMERICA," largest liner ever built in the United States, as she entered New York harbour from the builders July 29, 1940

There were in 1940 31 private shipyards in the United States engaged in the construction of seagoing vessels, of which not less than 20 were building naval vessels of various types; others were building merchant vessels only, while some of the 31 were building both naval and commercial vessels.

Employment in the private shipyards and ship repair yards of the United States was in 1940 about 45% in excess of the employment in 1939.

An outstanding event of 1940 in British shipbuilding was the completion of the "Queen Elizabeth" at the works of John Brown and Company, Ltd., Clydebank, Scotland. This vessel arrived in New York on its first trip across the Atlantic on March 7, 1940.

In the United States an outstanding event was the completion and delivery of the "America," the largest merchant vessel ever constructed in the United States. This vessel was designed to operate in the north Atlantic service of the United States lines in conjunction with the "Manhattan" and "Washington." Its main characteristics are: length overall 723 ft., breadth 83 ft. 3 in., draught loaded 32 ft., gross tonnage 24,454, shaft horse power 37,400, normal sea speed under average sea conditions 22 knots.

Fire-resisting material was used in staterooms, public spaces and throughout this vessel and proved conclusively that it is possible to produce pleasing effects with material of this kind, while at the same time adding greatly to the safety of the vessel against fire risks.

The "America" is very effectively subdivided so that any three adjacent water-tight compartments of the ship could be flooded without submerging the vessel beyond the margin line.

The first important contract initiated by the maritime commission after the "America" was by arrangement with the Standard Oil Company of New Jersey under which that company would construct 12 twin-screw vessels with a designed speed of not less than 16½ knots, the commission to pay the cost of national defence features. These vessels are of 11,335 gross tons with a capacity of 145,000 bbl., length 553 ft., breadth 75 ft., draught 29 ft. 10½ in. These vessels have been completed and have operated at better than 18 knots. All of them have been taken over by the navy department.

Of the cargo vessels, the first lot for which contracts were placed were of the C-2 type. They were designed for a maintained operating speed of 15½ knots. Gross tonnage 6,200. Displacement at load draught, 13,876 tons. Cubic capacity 506,911. Length overall 459 ft. Breadth 63 ft. The type of propelling machinery varies with different contracts awarded—some are propelled with turbine reduction gears, some with internal combustion engines (direct drive) and others with internal combustion engines with reduction gears. The shaft horse power of all units is about 6,000. These vessels have given very satisfactory results in operation. The fuel consumption of the steam installation is as low as 0.545 lb. per h.p. per hr.

The second type of vessel is the C-3 class. This design was made to satisfy the demand for vessels of great deadweight cargo carrying capacity and greater speed than the C-2 design. Displacement 17,615 tons, gross tonnage of the steam propelled design 7,770. Shaft h.p. 8,500 and normal sea speed under average sea conditions at load draught, 16½ knots. Cubic capacity 730,550. Fifteen of these vessels had been delivered, were in service and showed good results in operation.

Eighteen of the C-3 type of vessels were being built as combination cargo and passenger carriers. Some of them were designed to carry 96 passengers with 124 officers and crew; others to carry 196 passengers with 155 officers and crew.

The third standardized type of maritime commission vessels is the C-1 design. These vessels were designed to meet the need for efficient, economical cargo carrying on trade routes not requiring excessive speed and where large cargoes might not be continuously available. Displacement at load draught 11,100 tons. Gross tonnage of steam propelled type 5,028. Length overall 413 ft. Breadth 60 ft. Depth molded 37 feet 6 inches. Shaft h.p. 4,000. Normal sea speed under average sea conditions 14 knots. Cubic capacity 451,000. Four of these vessels had been delivered in 1940.

There are some variations in the arrangements of particular vessels of each type to meet the requirements of special services.

The balance of the fleet, aside from additional oil tankers, building under the jurisdiction of the maritime commission consisted of a total of 28 vessels for the American Export Lines, Inc., Seas Shipping company, Mississippi Shipping company and the United States Lines. (H. G. S.)

Other Countries.—Except in the occupied countries on the continent,

where there was naturally a complete absence of authentic information shipbuilding in Europe during 1940 followed the indications of 1939 very closely. In Britain there had been no need for any great alteration in the government policy laid down at the beginning of the war, and the greatest effort was in the production of cargo tonnage of the simple-specification tramp class which normally falls into two groups, with speeds of roughly 10 and 12½ knots. Faster ships were not debarred if they could be produced quickly and efficiently. Established shipyards were encouraged to continue building their own specialties, and proved designs were accepted except when they were obviously unsuitable for war purposes, for repeated production.

The output of naval and mercantile tonnage was divided about equally and the British government was hoping that 1940 would beat the peak mercantile figures of the previous war, 1,338,000 gross tons in the year 1918. There was certainly considerably greater output for every man employed, due to improved machinery and layout and the specializing policy of the various yards, but the men themselves were making a magnificent effort and the time kept was better than in peace. There were few exceptions to this, principally in the South Wales repair section, and the men's workmates generally dealt with the matter adequately. The principal check to improved output, which could not be avoided, was the exceptionally bad weather in the early part of the year.

Private shipowners were given permission to place orders provided the plans were approved by the government, but very few of them cared to shoulder the unknown liability of increasing costs, for the builders would not consider contracts at a fixed price, but insisted on the "time and line" basis.

The hulls were generally produced far more quickly than the engines, fully justifying the government's policy of simplifying the machinery as much as possible and doing without such refinements as superheaters although the designs provide for their being installed without difficulty after the war. The diesel engine was not debarred as it was suggested that it would be at the beginning of the war; quite a large proportion of the faster cargo ships, with a speed of about 12 knots, were fitted with it, but the simplest steam engine was preferred where possible both for speed of production and wartime crews. The diesel engine makers were standardizing their cylinder dimensions and other factors as far as possible, simplifying the supply of spares and repair work, and four-stroke cycle engines were fitted with cast-iron propellers instead of bronze.

The organization of repair work was naturally the most difficult part of the industry, with a constant stream of war casualties requiring immediate attention and the ordinary maintenance repairs and overhauls having to be carried out whenever the opportunity arose. Excellent results were shown in most areas, although they were naturally uneven, as some yards had to carry out their work under constant enemy attention while others were almost immune.

This inequality of working conditions made it necessary to prepare a scheme for transferring labour if any yard should be put out of production or if inequality of production were slowing down the main war effort. After the war had been in progress for a year there were still 9,000 registered shipyard workers unemployed, against 30,000 in Sept. 1939, but this figure was taken on a certain day and there are always men idle between repair jobs if a certain reserve of labour is to be maintained. Of the remainder it is probable that the majority were quite unfitted for shipyard jobs under modern conditions, although they had been registered as shipbuilding workmen with the ministry of labour. The national register of men with engineering experience and qualifications who were not employed on war work produced a large number of names, a due proportion going to shipbuilding and marine engineering in which there was a serious shortage of skilled labour.

One of the most striking features of the year was the extraordinary elasticity of British shipbuilding, the steady acceleration of normal work going on without interruption in spite of the urgent demands imposed from time to time by the rapidly changing situation.

Shipbuilding in the axis countries was proceeding with the greatest secrecy. There was every reason to believe that in Germany the effort was mostly concentrated on men-of-war, principally submarines, destroyers and escort craft, for the country had at its command sufficient tonnage for the small cargo movement in the Baltic and along occupied coasts. Japan had radically curtailed its shipbuilding efforts, largely centred on the tramp class in which the Chinese operations had revealed a serious shortage; and before the treaty with Germany and Italy was signed, and the supplies of scrap metal from the United States were stopped, there was every evidence that the lack of steel was very serious, for the government permits for its release were only being honoured for about half the amount mentioned.

The complete stoppage of news concerning the shipbuilding industries in the occupied territories suggested that their facilities were being used by the Germans for the production of the types which they required, but the shipyards in Denmark and Holland, although among the finest of their class in the world, were not laid out for the rapid production of warships of any type. In Italy the shortage of steel would seem to have been felt even more than in Japan.

The shortage of tonnage offered an opportunity to establish the shipbuilding industry in Australia, where it had been planned for some years past. The Broken Hill Proprietary Ltd. started building warships and merchantmen at Whyalla; and in other centres where materials were readily available preparations were being made to build merchant ships up to 12,000 tons. The cost of Australian labour is high for the value of the ships in normal circumstances, but it was hoped to establish the industry while war conditions made price a secondary consideration. (F. C. Bo.)

Shipping, Merchant Marine. The dislocations to American shipping brought about by the war in Europe continued to be the most important fact affecting the United States merchant marine during 1940. The Pittman Neutrality act, which became a law Nov. 4, 1939, barred

seven lines employing 86 ships from their customary routes in the north Atlantic; and the extension of this law to cover the Mediterranean area in June 1940, after Italy had entered the war, resulted in the discontinuance of the Mediterranean operations of 28 vessels operated by four lines. During the balance of 1940 all of these vessels were put into service again through sale, charter or rerouting.

Lykes Bros. Steamship company increased its far eastern service from 8 ships to 20 ships. American Export lines added 4 vessels to its Indian service, making 9 in all. The American President lines continued its far eastern services on a weekly basis, and the first of its large new cargo-passenger vessels, the "President Jackson," went into service toward the end of the year.

The Puget Sound-Orient line was transferred by the maritime commission to private ownership during 1940. This line, which runs from Puget sound to the far east, is called the American Mail line. It operated 6 vessels in 1940. The American Pioneer line's Indian service, with the 4 vessels operating in that service, was sold to American Export Lines, Inc., late in 1939. Its far east, Atlantic and Gulf-Australian services were sold to the United States lines in Feb. 1940 and at the same time the 12 vessels which had been operated by American Pioneer in those services were chartered to United States lines.

In Latin America the American Republics line had 22 vessels in the east coast service. The Pacific Republics line, formerly the Pacific Argentine Brazil line, operated 4 vessels from the west coast of the United States to the eastern coast of South America. The Mississippi Shipping company added 3 ships to its Gulf-east coast of South America service, making a total of 10 in all under its flag.

To the west coast of Latin America the Grace line ran 9 vessels from the east coast of the United States and 7 from the west coast. It also had 6 vessels in service from the east coast of the United States to the Caribbean islands and the north coast of Latin America.

A marked increase in the sailings of the Isthmian Steamship company was noted, due to the withdrawal of much competing foreign flag tonnage and to a substantial increase in movements of various types of cargo. The Ocean Dominion Steamship company, which changed its name to the Alcoa Steamship company, purchased 8 new vessels from the maritime commission for service to the Caribbean islands and the Guianas. As a result of the increased tempo of the maritime commission's construction program, 179 ships were contracted for as of Dec. 1. Eighty-five of these had been launched, and of these 85, 55 were in service, as of the same date.

The navy during the year 1940 acquired 12 twin-screw national defence tankers, and 11 other vessels built under the maritime commission's program for use as cargo and ammunition carriers, seaplane and submarine tenders, transports, etc. It also bought 14 older cargo ships, and about 100 smaller boats for trawlers, etc. The requirements of the navy for new cargo vessels, as well as for warships being built under the two-ocean navy program, served to keep every active American shipyard full to capacity throughout the year.

The sale of over-age American merchant vessels to Great Britain, Canada and other countries reached a high figure during the year. A total of 338 ships of all types, of 1,211,998 gross tons, were sold to alien purchasers during the period Sept. 1, 1939-Dec. 1, 1940. Of these, 130 of 470,732 gross tons were sold to British purchasers; 42 of 60,259 gross tons were sold to Canadian purchasers; 28 of 117,906 gross tons to French and Belgian buyers. The sale of these over-age vessels, while it did not interfere with the operations of U.S. vessels in foreign trade, did cause shrinkage in certain coastwise services. Some coast-

wise lines suspended operations entirely, including the Moore-mack Gulf line and the Lykes Gulf line; and the services of other lines were somewhat contracted.

The regulatory powers of the maritime commission over continental coastwise and intercoastal shipping were, under the Transportation act of 1940, transferred to the interstate commerce commission as of Jan. 1, 1941. No drastic changes in regulatory policies were envisaged as a result of this transfer.

The charter market continued high during the early months of 1940, reaching its low point in June with the shutting off of the Mediterranean to United States vessels. After July a steady increase in charter demands took place, and in December the market was as high as at the first of the year. Many vessels of foreign flags, including Norwegian, Swedish, Yugoslavian and Panaman, were chartered to American operators.

Freight rates also went up during the year, from 10% to as much as 100% in some cases. Most marked increases were noted in commodities which used to travel in tramps, since practically all tramp shipping was withdrawn as a result of the war.

War risk insurance was in effect on nearly all United States vessels in foreign trade, thus increasing cost of operations measurably. The maritime commission made substantial progress in its training program for licensed and unlicensed seamen and apprentices. Including special national defence classes in radio, visual signalling and gunnery, over 10,000 officers, cadet officers, cadets, unlicensed personnel and apprentices chosen from the CCC camps were being trained by the end of 1940.

Repatriation of American nationals in Europe continued during the early part of the year. Three specially assigned United States lines vessels were sent to a French port and to Galway during June and July to aid Americans in returning home. At the end of the year the only American services going to Europe were the American Export lines, with Lisbon, Portugal, as their only European port, and the United States lines, which operated an occasional freighter to Vigo, Santander, Gijon and Bilbao, Spain. The state department, the maritime commission and ship operators arranged for the return of American nationals in the far east in the fall of 1940, and three special voyages were made by United States ships to bring back stranded citizens. The American President lines continued its fortnightly service from the orient and, after the original rush, was able to handle the requirements of home-coming Americans.

On the Great Lakes cargo shipments were heavier than ever, and the ore-carrying lines had the best year in their history. Most

UNUSUAL CLOSE-UP PICTURE of a German air attack on British shipping in the English channel July 26, 1940. The two merchant ships are untouched, but the escorting destroyer at the right has possibly been damaged

THE "QUEEN MARY," docked at New York city since Sept. 4, 1939, sailed for an unannounced destination March 21, 1940. Five weeks later she was seen at Cape Town, South Africa

of the trade consisted in carriage of iron ore from the head of the lakes to Lake Erie, and coal on the return voyage.

The first American vessel to be a victim of the war was the "City of Rayville," which was sunk on Nov. 8 off the coast of Australia. All but one of the crew were saved. The man who was lost was Mac B. Bryan of Randleman, N.C., who was third assistant engineer.

(E. S. L.)

Europe.—In 1940 all the merchant shipping in the world was naturally operating entirely under war conditions, which were felt even in the safest trades far away from the actual area of operations, and these conditions made business exceedingly difficult. As was the case in the War of 1914-18, German merchant shipping was immediately restricted to the shorter routes round their own coasts, and that only at heavy expense for protection. The same thing later applied to Italy. A certain number of vessels managed to evade the blockade and make their way to German ports, but the value of their effort was principally for propaganda.

As far as the British merchant navy was concerned, the most interesting feature of the year's history was the agreement as to rates of hire by the ministry of shipping, which was announced in the house of commons in April after payments on account had been made since the beginning of the war. This agreement was only reached after long discussions and covered the deep sea tramps and liners.

The agreement is a long one and it is only possible to give the principal features. For tramps it arranged a basic rate, with variations for special circumstances. The basic rate as from March 1 was on a sliding scale, varying from 6s. per ton per month for ships of over 8,000 tons deadweight to 8s. per ton per month for ships of from 5,000 to 5,250 tons. For the period before March 1 the rate varied from 5s.7d. to 7s.7d. on the same scale of tonnage.

In the case of deep sea liners the basic rate was intended to cover the normal running costs, plus 10% of the first cost of ships built since 1922 to cover 5% depreciation and 5% return on capital. In their case the basic rates vary from 13s.7d. per gross ton per month for passenger liners of 18 knots and over with white crews, to 7s.7d. per gross ton per month for cargo liners with Asiatic crews. In all cases there was an extra shilling per month for motorships.

Coasting tramps secured what were regarded as rather better terms shortly after the main agreement was published, but the important question of tankers was still left under discussion and the coasting liners were excluded although their normal trade was particularly hard hit by conditions and they made several appeals to be brought under the requisitioning scheme.

Neutral ships were naturally paid infinitely higher rates than the British requisition scale, but when the German invasion of Norway, Holland, Belgium and Denmark, and the collapse of France gave Britain the services

of a large number of ships the high rates enjoyed by neutral shipowners immediately declined and a number of the cargo ships were laid up, although those fitted with passenger accommodation were fully utilized. The Allied ships in British service continued to be paid very much higher rates than the ministry of shipping scale.

The ministry of shipping published a review of the position after a year of war, when it was shown that the tonnage added to the British flag had appreciably exceeded the losses. The latter have been published weekly, divided into British, Allied and neutral; Norwegian tonnage counted as neutral from the outbreak of war until April 9 and Belgian and Dutch ships until May 10, when they were classified as Allied. During the period the axis war against shipping succeeded in destroying 396 British ships of 1,561,193 tons gross, 98 Allied ships of 455,854 tons gross and 255 neutral ships of 778,948 tons gross, a grand total of 749 ships of 2,795,995 tons. Against this the British merchant navy was increased by just over 2,000,000 tons of shipping—new ships delivered, ships purchased from neutral countries (principally Panama and the United States), ships captured from the enemy and ships pre-empted from the Danish flag after the invasion and the French flag after the collapse, which otherwise would have been used by Germany against Britain.

In addition there were, at that time, about 750,000 tons of neutral shipping on time charter, principally of the tramp class. Quite apart from the ships actually flying the British flag there were between 6,000,000 and 7,000,000 tons of Allied shipping—Norwegian, Belgian and Dutch—of which by far the greater part was assisting in the British war effort. Against these satisfactory figures, however, should be placed the facts that convoy delays cause a serious waste of tonnage and that difficulty in getting repairs and overhauls promptly executed means a further delay, especially in the tanker class.

Apart from delays, full weight must also be given to the fact that the practical closing of European sources of supply forced ships on national service to make very much longer voyages, so that, in spite of the exclusion of all but essential cargoes, the situation was still serious and the greatest care had to be taken to utilize every ton of space. A number of passenger liners which would normally lift large quantities of parcels cargo were in government service as auxiliary cruisers and transports, which also had to be considered.

Apart from this there is no doubt that the German plans for the destruction of British commerce had signally failed, although it is not pretended that the losses were not serious. The original German war plan covered the destruction of 2,000,000 tons of British shipping in the first month of war; this was not achieved in a year, and in the first four months, when the element of surprise was greatly in favour of the submarines and minelayers, the result, including neutrals, was less than one-third the amount estimated for four weeks.

The other side of the account, German and Italian losses, is admittedly incomplete, for the British government's policy is to include only those ships which are definitely known by name to have been destroyed, and to exclude from the return all "moral certainties" or "probabilities." Yet the Germans were known definitely to have lost, in the first year of operations, 129 ships of 644,155 tons and the Italians 41 ships of 222,528 tons, the latter having had the great advantage of being able to get the majority of their ships into safe positions before they declared war. Of these, 58 German and 29 Italian ships were captured and put into Allied service, a large proportion of the remainder having been scuttled to avoid capture. This practice led to a very important case in the courts of law (the King's Bench Division) when it was decided that British cargo lost in scuttled ships did not come under the ordinary pre-war marine policy.

A large number of German with many Italian and a few neutral and French ships had been sheltering in neutral ports rather than run the risk of a sea voyage; some German ships had slipped out to run the blockade back to Germany and some in order to supply raiders, but the number which had succeeded in their object was small.

The invasion of Norway by Germany gave to the British service practically the whole of the huge Norwegian tanker fleet, the third largest in the world, at a time when it was most needed. Against all pre-war calculations, oil fuel had been easier to obtain and no dearer than coal although more coal was available for bunkers when the French market collapsed. This did not, however, make as much difference as it might have done, for distribution has always caused far more trouble than production.

The prize ships, those purchased from foreign flags, and those secured from Denmark and France, were registered in the ownership of the ministry of shipping, but placed under experienced firms for management. In the case of Danish ships these managers were often British-flag firms intimately connected with the original owners.

In view of the very strict control of all tonnage, and the profits of all shipping companies, the second-hand market was practically dead.

Apart from the purely neutral routes which are largely covered by American tonnage, and the British charters mentioned, there was very little business for free tramps and most of it was in connection with the supply of foodstuffs to such countries as Spain and Switzerland. The majority of the neutral tramps which found business were on time charter rather than voyage; when business was arranged on the latter basis the rates appeared high compared with pre-war levels, but in many cases they did not meet the increased running costs and insurance. Practically, the profitable voyage charter business was ended when the United States government placed its embargo on the export of scrap to Japan, for which business there had been good demand at a fair price which had generally been accepted by Scandinavian or Greek ships.

Neutral shipping, except that deliberately attempting to supply the axis powers, suffered very little inconvenience from the navicert system of economic control which was made to work very smoothly and which was generally honoured. In September it was, however, necessary to reimpose the Black List which was so effective at the end of the late war and a number of Yugoslav, Turkish, Greek and other steamers, mostly of very advanced age, were placed upon it.

Under pressure from Germany, the Vichy government published a plan for the future of French shipping which provided for the abolition of luxury liners and concentration on cargo liners of fair size and speed. The French shipping community naturally objected to it as it would give the cream of the post-war business to Germany, while the general public was indignant as it dared to be at the obvious intention of diverting the American tourist business away from France. As far as published German and Italian intentions were concerned, the plans were those laid down before the war, with the addition of prize ships.

In consequence of the number of ships sunk by submarine, mine and air bomb, the British ministry of shipping tightened up the life-saving regulations, especially in matters of detail concerning the equipment of life-boats which had been very generally adopted without government regulation, and the acceptance of various life-saving devices which had been put on the market. All ships built for the government were being equipped with motor life-boats, but although the practice was strongly recommended, problems of supply made it impossible to lay down a definite rule for vessels which were already built. The provision of new davits is an important factor and the acknowledged fact that a motor life-boat whose engine will not work is of far less value than an efficient pulling boat, had to be taken in conjunction with the shortage of trained engineers who would, in addition to their normal work in the engine room, be able to keep these life-boats in good running order. (See also BLOCKADE; INTERNATIONAL TRADE; NEUTRALITY; SHIPBUILDING; STRATEGY OF THE EUROPEAN WAR; SUBMARINE WARFARE; UNITED STATES.) (F. C. Bo.)

Shock Treatment: see NERVOUS SYSTEM; PSYCHIATRY.

Shoe Industry. War and defence measures, the world over, interfered with the progress of shoes and leather. Future implications were that reduced production, control of types of shoes and a limitation of price and use would come to pass in 1941.

Even U.S. shoemaking declined but not for the same reason. Shoe production in 1940 reacted from the high level reached in 1939. The Jan. 1, 1941 position of the trade was short inventory, a rapid buying bulge and an extra production in the field of men's shoes, covered by army and navy demands, tremendously increased because of the U.S. trainee policy for defence.

World Trading.—Limited to cargo bottoms, the movement of millions of hides and skins was seriously curtailed. Nations at war could not get the heavy leathers, and nations at peace either could not afford the leather or relied upon domestic supply. Nor-

mally, 250,000 hides and skins are imported into the United States every working day of the year. Kid skins—99.9%—continued to flow in. The fine calfskin market of middle Europe was closed completely. The novelty skins—kangaroo, crocodile, etc.—were available, though subject to shipment delay. The cattle hide demand was greater than the U.S. take-off, so Argentine hides came to the U.S. market but the U.S. could not consume the world surplus accumulated there.

World Production.—Machine-made production in 1940 was reduced considerably because civilian use was secondary to military use and the nationals were expected to wear what they had. Nevertheless, even in belligerent lands footwear fashion found new expression in men's, women's and children's shoes.

Rubber Footwear.—Rubber boot, galosh, shoe and sandal manufacture showed a high record of production in 1940. War wear first, protection against the elements increased the manufacture and the quick consumption of rubber protective footwear. And because certain types of wearables can be finished more cheaply with rubber-moulded bottoms, there was an immense increase in lightweight civilian rubberized footwear the world over. (A. D. An.)

Shows. **Horses.**—The American Horse Shows association in its annual list of horse shows in the United States scheduled 162 horse shows held in 1940. Of these 127 were by organizations that were members of the association and 35 were by organizations whose shows were licensed by the association. This total, however, by no means represents the number of horse shows, which, counting small local shows and shows held in connection with county fairs, runs to much more than 1,000 annually. Most of the state fairs provide for somewhat elaborate horse show programs as do the annual American Royal Livestock show at Kansas City and the annual International Livestock show at Chicago. The National Horse show, which is the most famous of United States horse shows, held its 55th annual show Nov. 7 to 13, 1940, at Madison Square garden, New York city, with a program "dedicated to national defence and preparedness" and with the proceeds donated to the American Red Cross. Previously, horse-drawn artillery had been an interesting part of the National Horse show, but in 1940 this feature was replaced by "mechanized cavalry" consisting of tanks, armoured scout cars, field kitchens and motor-drawn artillery. Another wartime effect on the show was the absence of British and other military teams in the riding contests. The only army officers participating were those of the Chilean, Cuban, Mexican and United States military teams. The U.S. army team won the International Military Perpetual Challenge trophy. Major Eduardo Yanez of the Chilean army won the International Military Jumping stake, and Capt. Franklin F. Wing of the U.S. army won the International Individual Military championship. The Canadian "Mounties," heretofore one of the most colourful parts of the National Horse show programs, did not participate in the 1940 show. A new record was made in the contests for junior riders when James A. Thomas, Jr., of White Plains, N.Y., 16 years old, won both the MacLay trophy in jumping and the Welling Good Hands cup in a large field of junior riders. (S. O. R.)

Dogs.—Wars and rumours of wars did not in 1940 affect unfavourably "man's best friend" in the U.S. Dog shows numbered around 298 and breed registrations totalled 90,000, an increase over the previous year, with the merry little cocker still leading; other leading breeds in order—beagle, Boston, scottie, fox terrier, dachshund, Pekingese, springer, greyhound, collie. The largest dog show, also world's largest, one day outdoors, was the Morris and Essex show, Madison, N.J., with 3,462 dogs actually on the benches. Rip, golden retriever, and Solo Event, springer, were con-

sidered outstanding national winners in retriever and springer trials respectively. The smooth fox terrier champion Nornay Saddler, after winning 55 best-in-show triumphs at all-breed shows, a world's record, was retired. National dog week, Sept. 22-28, was observed in 237 cities and communities.

(W. Ju.)

Livestock.—Under world conditions of 1940, when the major British and continental livestock shows and fairs ceased to exist because of the war, the Chicago, Ill., show more than ever stood far in the lead as the world's largest event of its kind.

The 41st annual International Livestock exposition was held from Nov. 30 to Dec. 7, 1940. A total of 11,658 head of beef cattle, draught and light horses, sheep and swine were exhibited, with entries of both livestock and crops exhibited by stockmen and farmers from 36 states and five provinces of Canada.

First of the major U.S. shows in calendar position is the National Western Stock show at Denver, Colo., held in its 34th renewal Jan. 13 to 20, 1940. It was closely followed by the leading sectional agricultural show of the southwest, held in Ft. Worth, Tex. It is known as the Southwestern exposition and Fat Stock show. The 44th renewal was held March 8 to 17. It is the oldest stock show in the United States.

The eastern and western seaboard each have annual shows that include all breeds of livestock, but with major accents on the dairy breeds. These are the Eastern States exposition, founded in 1917 at Springfield, Mass., and held Sept. 15 to 21, 1940, and the Pacific International Livestock exposition, founded in 1911, and held in Portland, Ore., Oct. 5 to 12, 1940.

Two shows of national calibre feature the dairy breeds, one a midwest fixture, the National Dairy Cattle congress and National Belgian Horse show at Waterloo, Iowa, the other the National Dairy show, which since it was founded in Chicago in 1906 has, in later years, become an itinerant show.

The National Dairy show was held regularly in Chicago, using the same facilities as the International Livestock exposition, from 1906 to 1920. From then to date it has moved each year to different cities. The 1940 National Dairy show was held in Harrisburg, Pa., Oct. 12 to 19. The 31st Dairy Cattle congress took place in Waterloo, Iowa, Sept. 30 to Oct. 6. The National Belgian Horse show, held in connection, is the largest annual exhibition of this draught breed in the U.S.A.

Kansas City, Mo., is widely noted in agricultural circles as the home of the famous American Royal Live Stock show. The horse show is a particularly strong feature of this exposition, which celebrated its 41st renewal Nov. 9 to 16, 1940.

Huge livestock shows are held during the late summer months at the various midwest state fairs, which are preceded by county and district fairs that take place earlier in the season. On the basis of livestock exhibits, the major state fairs are held in Illinois, Indiana, Ohio, Iowa, Wisconsin and Minnesota. The Kentucky state fair at Louisville attracts the largest annual showing of saddle horses of any fair or show in the U.S.

Canada.—Canadian war activities disrupted, in part, the schedule of dominion agricultural shows. The two major Canadian expositions, both held in Toronto, Ont., are the Canadian National exposition, a summer show, and the Royal Winter fair, a November show. The latter show was not held after 1938, but the Canadian National, founded in 1879, was held from Aug. 23 to Sept. 7, 1940.

Europe.—Oldest of all the world's livestock shows are the Highland show of Scotland and the Royal Agricultural show of England. The Highland celebrated its 108th anniversary in 1939, and the Royal was 98 years old the same year. Neither was held in 1940.

South America.—South America's largest agricultural show,

the Palermo, was held in Buenos Aires from Aug. 17 to 30, 1940. Unlike similar expositions elsewhere in the world, judging of livestock there is completed before the exposition is officially opened to the public.

(W. E. O.)

Siam (Thailand). A kingdom of southern Asia between Burma and French Indo-China, extending southwards into the Malay Peninsula; area 198,247 sq.mi.; pop. (census 1937) 14,464,489, (est. 1938) 14,976,000. Chief towns: (pop. 1937) Bangkok (cap. 681,214); Chiangmai (544,001); Khonkaen (473,475); Chiangrai (443,476). Ruler: King Ananda Mahidol; language: Siamese; religion: Buddhism.

History.—During 1940 the king, aged 15 in September, continued his education in Switzerland, the country being governed by a council of regency under his cousin, Prince Aditya.

Thailand, known as Siam prior to May 1939, followed up her proclamation of neutrality made at the outbreak of the European war with treaties of non-aggression arrived at between herself and Great Britain, France and Japan and signed on June 12. The first named was ratified on Aug. 21 and in September an official mission left Bangkok on a round of visits to Burma, India, Malaya and Australia with a view to promoting friendly relations with the British empire. But ratification of the French treaty was postponed until certain modifications of the frontier between Thailand and French Indo-China, negotiations for which were at the time in progress, had been made, and in mid-September Thailand demanded of France the cession of border territory with certain islands in the Mekong river. This step seems to have been taken largely because of the uncertainty of the future of the French colony, especially in view of Japan's possible actions which, it was feared, might foreshadow an attempt to use Thailand as a highway to Singapore in the event of future hostilities. Early in October the Thai prime minister gave the assurance that his country would not resort to arms to make good its claims, and that an arbitration commission would be called to settle the frontier questions; but in November French males in Indo-China between the ages of 40 and 50 were called up, indicating that the dispute had become aggravated.

Education.—In 1936-37: elementary schools 8,983; scholars 1,151,915; secondary schools 206; scholars 42,225; special schools 2,984; scholars 33,087; universities, number of students enrolled 11,525.

Banking and Finance.—Revenue, ordinary (est. 1939-40) 124,060,700 baht; expenditure, ordinary (est. 1939-40) 124,058,100 baht; expenditure, capital (est. 1939-40) 22,889,360 baht; public debt (Mar. 31, 1938) 80,593,000 baht; notes in circulation (June 30, 1939) 151,000,000 baht; exchange reserve (June 30, 1939) 127,000,000 baht; gold reserve (June 30, 1939) 18,000,000 baht; exchange rate (approx.) 11 baht = £1 sterling.

Trade and Communication.—Foreign trade 1938-39 (merchandise): imports 123,575,000 baht; exports 173,078,000 baht. Communications: roads, state highways completed (1938) 1,815 mi.; railways, open to traffic (1938) 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937-38): total 11,439 (cars 5,910; lorries 4,233; buses 146; cycles 559); wireless receiving set licences (1938) 29,834.

Agriculture and Mineral Production.—Production (in metric tons): rice (1938) 4,937,400; rubber (1938, exports) 42,000; tin ore, metal content (1938) 14,000; soybeans (1937) 9,721; tobacco (1937) 8,033; cotton (1937) 7,083; maize (1937) 5,025.

Sierra Leone: see BRITISH WEST AFRICA.

Silk and Silk Manufacture. In the textile war of 1940, silk met with successive

defeats. The rising prices of 1939 dealt the final blow to the sole remaining field of silk fabrics. Underwear fabrics almost exclusively of pure silk up to that time, turned in 1940 to combinations of rayon and silk or all rayon with successful acceptance by the consumer markets. Nylon hosiery, offered for sale in the United States in May 1940, for the first time in commercial quantities, was sold by many merchants under an arrangement of two pairs of silk hosiery for every one of nylon in an effort to stem the tide of favour to the new fibre.

In Great Britain, as of Oct. 16, 1940, licences were required for the use of raw silk for any purpose other than government or export orders. The sale of silk hosiery and silk piece goods was prohibited after the end of November.

Both in the United States and Great Britain, concern centred in the potential supply of raw silk, due to strained diplomatic relations with Japan. The stock situation at the close of the year was said not to warrant immediate alarm. The total estimated stock of 72,248 bales as of Jan. 1, 1941, represented nearly three times the average monthly consumption of 1940 and the prospects were for lower rather than higher consumption during 1941. The total consumption for 1940 was over 20% less than for 1939. Demand for silk was the lowest since the war of 1914-18. Average 1940 prices on the New York market did not vary materially from the 1939 average but the general loss of interest in silk was indicated by the constantly dropping price through the year. Beginning at \$3.09 a pound in the first third, the end of December showed \$2.55 a pound.

Hosiery manufacturers took a smaller proportion of silk in 1940. In a comparison of raw silk deliveries in July through October, four months, going to hosiery there was a decrease of seven points in 1940 over 1939. The changing proportion was partially accounted for by increased consumption of silk by mills on defence orders for parachute silk and such smaller wares as silk sewing thread, silk neckerchiefs, silk cords and braids, etc. Several million yards of parachute silk were ordered and the necessary raw silk purchases by weavers meant a shifting in the proportionate rate of weaving to knitting consumption. A substantial amount of the silk imported, however, at the close of the year, was reported to be held by importers in the warehouses, in anticipation of any interruption in shipping due to world conditions.

Elsewhere in the world, silk's condition was no more promising. The French surrender resulted in virtually a complete stoppage of exportation. Lyons, the silk city, was unoccupied territory and manufacturers hoped that exports could continue at least in restricted quantities. The last available reports on actual shipments were for September when exports for the September quarter were valued at \$11,099, as compared with a 1939 value of \$187,062. A subsequent government decree of Sept. 13 imposed export restrictions that eliminated all silk shipments. In Italy, production of silk cocoons during 1940 was about 34,000,000 kg. as against 28,400,000 in 1939, but trade was slow. During the first six months of 1940, exports to the United States amounted to 404,809 lb. valued at \$953,617. Chinese raw silk exports showed an increase. Approximately 3,500 bales were exported to the United States, by Japanese firms, during the first eight months of 1940, and most of this was in the better grades. Considerable quantities of waste silk were also shipped to the United States. The latter is essential in manufacturing cartridge bag cloth, a munitions requirement.

The importance of silk as an economic power in Japan was emphasized by the visit of a mission to the United States in the summer of 1940, under the leadership of the Honourable Gosuke Imai, life member of the house of peers in Japan and head of the great house of Katakura Silk Spinning company in Tokyo. Con-

ferences were held with representative silk consuming groups but the general impression was conveyed by the U.S. firms that the drift away from the use of silk was too advanced to stem. Later a printed interview with Senator Imai on his return to Japan quoted him as saying, on nylon, "in regard to its popular appeal as a substitute for silk it was not being received over-enthusiastically by the general public." In the face of retail sales records in nylon hosiery, commentators on this interview believed it indicated once more that the chief suppliers of silk were in a state of "wishful thinking." (See also RAYON.)

Silver. The world's silver production is rather heavily centred in North America; this continent in 1929 furnished 75% of the total output, and 61% in 1940; Mexico is the leading producer, with 29%, followed by the United States with 22%, Canada with 9% and the remainder of the continent (including Central America, West Indies and Newfoundland) 2%. The status

Total	261.5	169.7	275.1	264.1	258.9

of the important producers is shown in the accompanying graph and table.

World figures for the first nine months of 1940, although not quite complete, indicated a rate practically identical with 1939. Mexican returns through August were 10% ahead of the 1939 rate and about on a par with 1937. Mine production in the United States was 71,109,000 oz., an increase of 8%. Canadian output through September was practically identical with the 1939 rate.

The New York quotation on newly-mined domestic silver stood at 70.625 cents throughout 1940. The New York market for foreign silver opened at 34.75 cents, which held to May 20, ad-

SILVER PRODUCTION: world total and output of the major producing countries, as compiled by *The Mineral Industry*

vanced to 35.625 cents at the end of the month and then receded to the former level on June 4, remaining unchanged to the end of the year. The London market opened at 22*d.* and showed only minor changes until midyear; during the second half prices were slightly higher, with a high of 23.5*d.*, and the year ended at 22.5*d.*, with an average of 22.28*d.*, an advance of 8% over 1939; while the New York average, at 34.773 cents, was 11% below 1939.

British production of silver is comparatively small; the United Kingdom itself has only a negligible output, and empire production centres chiefly in Canada, Australia, Burma and South Africa. Empire production as a whole in 1939 was 18% of the world total against 16% in 1929. (See also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. RO.)

Simmons, Furnifold McLendell (1854–1940), U.S. attorney and legislator, was born in Jones county, N.C., Jan. 20. He was graduated from Trinity college, now Duke university, in 1873, and two years later was admitted to the bar and opened an office in New Bern, N.C. He served in the 50th congress from the second North Carolina district and at the expiration of his term resumed his law practice. He was a collector of internal revenue for four years from 1893. As chairman of the Democratic state committee of North Carolina he succeeded in reorganizing the party which had been demoralized by the Populist movement and winning the election in 1898. He was elected to the United States senate in 1901 and served five terms. While in the senate he was chairman of the finance committee for six years and was the co-author with Representative Underwood of the Underwood-Simmons Tariff act. He died in New Bern, April 30.

Singapore, the capital of the Straits Settlements (*q.v.*) and main port of southeastern Asia, located at the intersection of the trade routes to Australia and to India and Europe, is on an island, of the same name, 27 mi. long and 14 mi. broad, at the tip of the Malay peninsula. It is situated at 1° 20' N. The population of Singapore island (June 30, 1939) was 727,564. The great British naval base at Singapore is on the northern side of the island, on the Strait of Johore. It possesses vast dry and floating dock facilities; but up to the end of 1940 few ships had taken advantage of it, as the bulk of the British navy was stationed in European waters. There was a land garrison of about 7,000 men in 1940 and the royal air force maintained two bomber and two reconnaissance squadrons there. Singapore is generally considered the strategic key to the British position in southeastern Asia, protecting the neighbouring Netherlands Indies and also covering the approaches to Australia and India.

(W. H. CH.)

Singer, Harold Douglas (1875–1940), U.S. alienist, was born in London, Jan. 7, and studied medicine at the University of London, St. Thomas's hospital and the Royal College of Physicians. He served in hospitals in London from 1898 to 1904, when he went to the United States to become associate professor of neurology at Creighton university, Omaha, Neb. He became director of the Illinois State Psychopathic institute in 1907, holding that post until 1920. He was state alienist for Illinois from 1917 to 1920 and medical consultant to the director of the United States Veterans' bureau from 1919 to 1922. He was appointed professor of psychiatry in the medical college of the University of Illinois in 1919, a post which he held until his death. Dr. Singer was a fellow of the Royal Society of Medicine and the Royal College of Physicians, and on June 7, 1940, was elected president of the American Neurological association. He died in Albuquerque, N.M., Aug. 29.

Sin Kiang (CHINESE TURKESTAN), area 705,769 sq.mi., population 4,360,020 (estimate of the Chinese ministry of the interior, 1936), is one of the largest, most remote, isolated and sparsely populated regions of China. The name means New Dominion and it is not an integral part of China, being separated from China proper by vast stretches of desert and some difficult mountains. The principal towns are Kashgar (80,000) and Yarkand (75,000) in the southwest and Urumtsi (50,000) in the north. The latter is the seat of the Chinese administration. The chairman of the provincial government is Li Yung. Much of Sin Kiang is waste and desert country; but along the Kashgar and Yarkand rivers there is irrigation. The main products are cereals, fruits, vegetables, wool, cotton and silk. Economically Chinese Turkestan has always gravitated toward Russia; and this tendency has been strengthened by the construction of the Turkestan-Siberia railway in the soviet union (opened 1930) which passes close to the frontier of the province. There is some caravan trade with British India and an old caravan route from Urumtsi has been utilized for the dispatch of soviet munitions and supplies to China. Soviet influence is strong in Sin Kiang, especially in the northern part, and foreigners are seldom allowed to enter the country, with the result that news is scanty and irregular. Since 1930 there has been sporadic fighting between troops supporting the Chinese administration and Turki insurgents in the southern part of the country. (W. H. CH.)

Slovakia. Slovakia, a republic in central Europe under German protectorate, bounded on the N., W. and S. by Germany, on the E. and S. by Hungary, has an area of 14,848 sq.mi., with a population of about 2,800,000, of whom the great majority are Slovaks, a Slav people closely akin racially and linguistically to their immediate western neighbours, the Czechs. The large majority of them are Roman Catholic, but there is a considerable Protestant minority. The most important racial minorities are about 100,000 Germans and 70,000 Magyars. The population is largely agricultural. There are few towns of importance; the capital is Bratislava (Pressburg) on the Danube, with a population of 125,000.

Slovakia, which formed a part of Hungary before 1918, was from 1918 to 1939 part of the Czechoslovak republic. Having been constituted as an autonomous province with its own government in Oct. 1938, Slovakia under its prime minister Joseph Tiso, a Catholic priest, leaned more and more towards national socialism and in March 1939, with the help of Germany, declared itself an independent republic. It signed a treaty with Germany according to which German armed forces received the right to occupy Slovakia at any time and to erect there military plants deemed necessary to Germany. In exchange, Germany promised to protect the independence and territorial integrity of Slovakia for 25 years. Slovakia pledged herself to conduct her foreign policy and to organize her army in agreement with Germany. During Germany's war against Poland in Sept. 1939, German troops not only acted against Poland from Slovakian territory, but Slovakia participated in that war, in spite of an often-stressed friendship between Catholic Slovakia and Catholic Poland. In Oct. 1939, Mgr. Tiso was elected president of the republic and Dr. Bela Tuka became its prime minister.

During 1940 the regime in Slovakia was co-ordinated even more closely with that of Germany. The replacement of Dr. Durčanský

as minister of foreign affairs and minister of the interior by Dr. Tuka and Sano Mach, respectively, intensified the national socialist trend. The Slovakian parliament was replaced by a state council with advisory functions; economic life was organized after the model of the corporate state. Jews were not only excluded from all participation in the political and cultural life, but also deprived of all their positions in the economic life of Slovakia and subjected to a fast-growing number of restrictions and disqualifications. On the other hand, the German minority in Slovakia enjoyed especially favourable treatment and organized itself along national socialist lines. As in her internal policy, so in her foreign policy Slovakia followed closely the national socialist party line. She established friendly relations with the soviet union and the prime minister's brother was sent as minister to Moscow. On Nov. 24 Slovakia adhered officially to the Rome-Berlin-Tokyo pact, which, in view of her position as a German protectorate, had been a foregone conclusion. Only with Hungary did her relations remain strained throughout. Frequent bitter complaints were heard about the treatment of the respective minorities in the two states and it was believed that Hungary still cherished the hope of including Slovakia again within her borders. On the other hand, many Slovak personalities joined abroad with Czech statesmen and politicians to form a new Czechoslovak government under the former president of Czechoslovakia, Dr. Eduard Beneš, and to work for the restitution of a "free Czechoslovakia within a free Europe." (H. Ko.)

Smith College. On Oct. 17, 1940, Herbert John Davis, formerly professor of English at Cornell university, was inaugurated as the fourth president of Smith college, following a year in which Mrs. Dwight Morrow acted as president after the resignation of William Allan Neilson. Because of world conditions there was no junior year abroad; the junior year in Mexico, which had been arranged to replace the junior year in Spain, was cancelled in August because of political conditions in Mexico. Enrolment at the college for the academic year 1940-41 was 2,083 students; the faculty numbered 246; and the number of volumes in the library was increased to 279,363. The endowment in 1940 was \$6,168,823. (M. H. N.)

Smithsonian Institution. The institution was founded in 1846 by bequest of James Smithson of England, "for the increase and diffusion of knowledge among men." The governing body is a board of regents. Executive officer, Dr. Charles Greeley Abbot, secretary. The institution directs six government bureaus; also the Freer Gallery of Art and the Division of Radiation and Organisms.

Activities in 1940.—*Smithsonian*: Completed fourth year of weekly educational radio broadcasts, "The World Is Yours," in co-operation with U.S. Office of Education and National Broadcasting company; published a volume of essays in historical anthropology of North America, prepared by members of the institution's anthropological staff, and dedicated to Dr. John R. Swanton in honour of his 40th year on the scientific staff of the institution; publications issued (Smithsonian and all its branches), 78; distributed, 146,156 copies. *National Museum*: Specimens added to collection, 212,474; numerous scientific expeditions in the field; 12 special exhibitions held; visitors, 2,506,171; publications issued, 30; distributed, 65,962 copies. *National Gallery of Art*: Gallery established by joint resolution of congress. Art works and building to contain them was a gift to the nation by the late Andrew W. Mellon. The gallery is designated as a bureau of the institution, but is administered by a board of nine trustees; David K. E. Bruce, president; David E. Finley, director. At the close of the fiscal year 1940, construction of the building was

nearly completed. It will be opened to the public early in 1941; estimated cost, \$15,000,000. The building will also house the Samuel H. Kress collection of Italian paintings and sculpture, a gift of Samuel H. Kress and the Samuel H. Kress foundation to the gallery. *National Collection of Fine Arts*: This name designates art collections administered by the Smithsonian institution. Seven special exhibitions were held; the 19th annual meeting of the Smithsonian Art commission (formerly National Gallery of Art commission) was held Dec. 5, 1939. *Freer Gallery of Art*: Added to its collections Chinese bamboo, bronze, jade, marble, painting and pottery; East Indian and Arabic manuscripts; Iranian (Persian) and Syro-Egyptian metal work; and Indian and Persian painting. Visitors, 108,770. *Bureau of American Ethnology*: M. W. Stirling, chief, directed an expedition, in co-operation with the National Geographic society, to Mexico, where 20 stone monuments, including one with initial-series date, were discovered at Cerro de Mesa and 20 at La Venta. Other field work on American Indians was conducted by the following members of the scientific staff: Dr. J. R. Swanton, Dr. F. H. H. Roberts, Jr., Dr. J. H. Steward, Dr. William N. Fenton; linguistic studies were conducted by Dr. J. P. Harrington; Henry B. Collins, Jr., continued work on prehistoric Eskimo material excavated in 1936 around Bering strait; Miss Frances Densmore, collaborator of the bureau, continued her study of Indian music; publications issued, 3; distributed, 13,984 copies. *International Exchange Service*: Official agency for the United States for interchange with other countries of governmental and scientific documents; packages of such material handled during year were 639,344; weight, 527,545 pounds. *National Zoological Park*: Dr. William M. Mann, director, conducted the Smithsonian-Firestone expedition to Liberia, and brought back 200 animals for the collections; new restaurant building begun under an allotment from PWA; total number of animals in collection, 2,550; visitors, 2,129,600. *Astrophysical Observatory*: The observatory maintained solar stations at Mt. Montezuma, Chile, Table mountain, Calif., and Tyrone, N. Mex., and continued work on a complete revision of all solar-constant values since 1923. *Division of Radiation and Organisms*: Carried on investigations in the field of radiation in relation to plant growth, especially photosynthesis, respiration and chlorophyll formation, factors influencing plant growth, and stimulative action of ultraviolet radiation. The division published 3 papers.

(C. G. A.)

Soap, Perfumery and Cosmetics.

Following Italy's entrance into the European war in June 1940 and the fall of France, supplies of certain raw materials used by these three industries were severely restricted in the United States. Italian talc, always esteemed for its fine quality by makers of talcum powders, face powders and "dry" rouges, almost disappeared from U.S. markets; while, with prices soaring, such products as Italian oil of bergamot and Algerian oil of geranium remained only in nominal supply. However, the situation with respect to aromatic materials was by no means as acute as it was in the war of 1914-18, nor is it likely to become so in view of the great progress made since then in the production of synthetic aromatics in the United States.

In 1940, political and military events abroad further emphasized a trend in U.S. consumer markets that was already noticeable in 1939, when many cosmetic producers, dubious of their ability to sustain sales volume without the help of those extravagant claims of efficacy from which they were restrained by legislation, turned to perfumery as a new source of revenue. In the words of one observer, it was remarkable how many cosmetics manufacturers had "quit making cosmetics and gone into the perfume business." The expanding industrial situation in 1940 fur-

ther stimulated the sale of perfume which, as an unequivocal luxury, is highly sensitive to the ups and downs of the economic cycle. But far and away the greatest impetus was given the expanding domestic perfume market by the fall of France, from time immemorial considered the greatest perfume producing country. Inevitably, thenafter, the American public asked itself whether so-called French perfumes were really coming from France; and, if so, were they any longer actually French?

In Great Britain the production of perfumes and cosmetics—as luxury goods—was moderately restricted by the government in 1940. And there also the government consistently stood out against any attempts to increase prices to meet the inevitable cost rises attendant on war conditions. As to the condition of these three industries in continental Europe there was little reliable information. By the same token it was not possible to gauge accurately the effect curtailed imports into the U.S. had in 1940 on the volume of domestic production. Dollar volume, susceptible to the pressure of countless variables, is never a reliable index of real

Value of Production of Soap, Perfumery and Cosmetics, 1939 and 1937
(Source: U. S. Bureau of Census)

	1939	1937
Soap and Glycerine	\$302,634,474	\$301,201,547
Perfumes, Cosmetics and Toilet Preparations	147,405,585	132,336,481

* Note the difference in increase of soap and glycerine which is a pretty staple industry as compared with that in a luxury industry (perfumes and cosmetics) from 1937, a bad year, to 1939.

volume. In these three industries, where so large a part of price may, and often does, represent intangible aesthetic satisfaction, it offers but a faint clue to actual production and consumption.

(H. T.)

Soccer. The game enjoyed an international flavour during the 1940 season when a team from the Club Atlanta, Mexico City, showed its supremacy during a series of six exhibition matches in New York city, Chicago, Ill., St. Louis, Mo., and Fall River, Mass., winning four of their games and tying two.

Of the three games played on Randall's Island, New York, the Atlantas defeated the N. Y. Americans 1-0, beat the Brooklyn Hispanos 6-2, and reached a 2-2 tie with a picked team of the American Soccer league. On the road the Atlantas tied the New England All-Stars 1-1 at Fall River; they defeated the All-Stars of St. Louis 6-1, and the Sports club, Chicago, 4-1.

The annual contest between the east and the west for the U.S. football association cup competition ended in a tie between the Baltimore club and Chicago's Sparta club. The national amateur cup was awarded to the Morgan Football club of Morgan, Pa., after defeating the Firestone F. C. of Fall River. The national junior cup was won by the Avelia F. C. of Pittsburgh from the Yorkville Celtics.

In professional soccer, the Scots-Americans, of Kearny, N. J., successfully defended the championship of the American league, defeating the Brooklyn team in the final of the Lewis cup competition. The German-Hungarians defeated the Swedish team in the New York state cup finals, after the Swedish eleven won the National league title. The Metropolitan league cup was awarded to the Bronx Scots, and the N. Y. state junior cup went to the Yorkville A. C. Juniors.

(J. B. P.)

Socialism. In the United States, the Socialist party, at a national convention in Washington, D.C., on April 7, 1940, nominated Norman Thomas for the fourth time as its candidate for president of the United States and Maynard C. Krueger of the department of economics, University of Chicago, as its vice-presidential candidate. These candidates ran on a platform

which maintained that democratic socialism constituted "the one road to plenty, peace and freedom." The party's national executive committee, at its July 21 meeting, issued a statement declaring its opposition to totalitarianism in every form and opposition likewise to U.S. participation in war. It declared, at the same time, that it did not "seek the repeal of the neutrality law under which England derives great benefit" and that it shared "the hope that the British people may defeat the nazi invader."

In the ensuing presidential election on Nov. 5, 116,796 votes were recorded as having been cast for the Socialist candidates, as compared with 188,014 in 1936 and 884,781 in 1932. The Communist party received 48,789 votes; the Socialist Labor party, 14,861. Daniel W. Hoan, Socialist mayor of Milwaukee since 1916, was defeated in April for re-election as mayor. The Social Democratic federation during the year urged maximum aid to Great Britain. Many figures prominent in international socialism, including Frederick Adler, secretary of the Labor and Socialist International, secured passage to the United States in the fall of 1940.

Great Britain.—In Great Britain, the British Labour party continued its vigorous support of the war. In May 1940, on the resignation of Prime Minister Chamberlain and the reconstruction of the British cabinet under Winston Churchill, C. R. Atlee, parliamentary leader of the Labour party, and Arthur Greenwood became members of the inner war cabinet. Herbert Morrison, head of the London Labour party and the government of London, was appointed minister of supply. Other Labour members appointed were: Ernest Bevin, minister of labour and national service; Hugh Dalton, minister of economic warfare; A. V. Alexander, first lord of the admiralty; D. R. Grenfell, secretary of mines; and Sir William Jowett, solicitor general.

In the reorganized cabinet in October, Ernest Bevin was taken into the inner war cabinet, while Herbert Morrison was made minister of home security. (See also LABOUR PARTY.)

Sweden.—In Sweden, the Social Democratic government remained in office during the year under the premiership of Per Albin Hansson, the cabinet containing 6 Social Democrats, 2 Conservatives, 2 members of the Agrarian party and 1 non-partisan specialist. At the regular election held in Sept. 1940, for the lower chamber, the Social Democrats elected 134 out of 230 representatives (a clear majority) as compared with 115 in 1936. The Conservatives won 42, a loss of 2; the Agrarians, 28, a loss of 8; the People's party (liberals) 23, a loss of 4; the Communists, 5, a loss of 2. The Swedish nazi party won no seats. The country during the year greatly increased its budget for defence. It was forced to make a number of concessions to Germany, but Premier Hansson maintained that these concessions were not "a surrender of our neutrality or independence and represented no change in our foreign policy."

Switzerland.—In Switzerland, the Social Democratic party during the year remained the second largest party, with 49 seats in the lower house out of 187.

Finland.—Socialists remained members of the Finnish cabinet during 1940, V. Tanner, former Social Democratic premier, acting as minister of food supply. A split situation developed in the Social Democratic party.

Denmark.—In Denmark, the Stauning government remained in office, though under strict nazi supervision. Records of all trade unions were confiscated by the nazis, who suppressed many civil rights.

Norway.—In Norway, Prime Minister Nygaardsvold, leader of the Labour government of Norway, and many of the Labour cabinet escaped to Great Britain after the nazi invasion and conducted the "official" government from London, from which the large Norwegian fleet of merchant vessels was directed. The

government in London maintained that "the battle for freedom and independence will not be given up." Within Norway, the commissioner appointed by the reich proclaimed the "abolition" of the Nygaardsvold government and of all political parties except Quisling's nazi-dominated organization. Much sabotage against nazi officers was reported.

France.—Following the French defeat, the French Socialist party disappeared as an organized force. Leon Blum, leader of the French Socialist party and former premier, was arrested on Nov. 19, 1940 and placed in a detention centre near Riom. Many other Socialists were interned. The C.G.T. was taken under nazi control.

Belgium and Holland.—The Socialist movements in Belgium and Holland were likewise liquidated by the Germans. All possessions of the Dutch Labour party were seized and the council of the Labour party dismissed.

Australia.—The Labour opposition in Australia, including the New South Wales Non-Communist Labour group, elected 36 members to the house of representatives in the 1940 elections, a gain of 4. The Ministerialists retained 38 seats. The Labour party refused to join a coalition ministry, but sent representatives, including John Curtin, F. M. Ford and N. J. Makin, to the advisory war council which co-operated with the government in the carrying on of the war.

New Zealand.—In New Zealand, the Labour party government, under Prime Minister Peter Fraser, took an active part in the prosecution of the war and advanced measures for wealth conscription, free national medical care and compulsory acquisition of land by the state. The left wing of the movement urged a program of thoroughgoing socialization.

South America.—In South America, Socialists were active in many countries, especially in Argentina and Chile. In Chile, they were represented by 4 members of a Popular Front cabinet which contained 6 Radicals and one Democrat. (See also COMMUNISM.)
(H. W. L.)

Socialist Party. A careful inquiry early in 1940 confirmed the general Socialist feeling that there would be no nationwide labour or progressive "third" party in the 1940 campaign. Hence the convention of the Socialist party held in Washington, D. C., April 5-7, nominated a national ticket and planned a vigorous campaign. The candidates named unanimously were Norman Thomas of New York for president and Maynard Krueger of Illinois for vice-president. The former had been the party's candidate in 1928, 1932 and 1936, the latter an assistant professor of economics at Chicago university.

The platform urged immediate democratic socialization as the alternative to a drift to fascism, and as the best way to increase the national income and divide it more equitably. This process requires, it held, social control of money, banking and credit, social ownership of the great national resources and the socialization of those monopoly and semi-monopoly activities which were not producing enough to meet social needs. The platform opposed U.S. participation in the war as fatal to U.S. democracy.

Events following the convention forced the war issue to the foreground. The party opposed peacetime military conscription as unnecessary to the national safety and a danger to democracy. It challenged the magnitude and lack of co-ordination of the armament program and saw it as in part the result of the failure of private capitalism to meet United States needs.

Under the most difficult conditions in U.S. history, the party got on the ballot in 29 states, containing about 75% of the population. It polled 116,796 votes. After the campaign it determined upon a wider, more intensive educational program through the preparation of a book developing its economic posi-

tion, through the enlargement of its weekly paper, the *Call*, and a better use of radio.

Socialized Medicine: see MEDICINE.

Social Security. The outstanding 1940 event in social security in the United States was the inauguration, on Jan. 1, of the benefits under the federal old age and survivors insurance program of the Social Security act. This was the result of the drastic changes made in the act in 1939 which, in addition to commencing the benefit payments two years earlier, changed its basic principles by providing greater protection to the oldest and lowest-paid workers and extending benefits to the families and survivors of the insured.

As the law stands, "primary" benefits to retired workers at 65 are computed at 40% of the first \$50 of the average monthly wage earned after 1936 or after reaching age 21, plus 10% of the balance, up to \$250 monthly. One per cent of the total is added for each year after 1936 with at least \$200 in wages. Thus, a worker who averaged \$100 a month in the preceding three years was entitled upon retirement in Jan. 1940 to \$25.75, which will be paid to him each month for the rest of his life.

Benefits for Wives and Children.—The wife of an insured worker, upon reaching age 65, is allowed 50% of her husband's primary benefit, or in the example cited above, a total of \$38.63 monthly for the couple. She may receive a larger primary benefit if entitled to one in her own right. Each unmarried dependent child of a retired worker may receive 50% of the wage-earner's primary benefits until he reaches the age of 16, or 18 if regularly attending school.

Benefits for Widows, Orphans and Parents.—The new program also protects survivors of insured workers who died after Dec. 31, 1939. A widow aged 65 or over is entitled to 75% of her husband's monthly primary benefits for the rest of her life unless she remarries. For every dependent child another 50% is paid. Widows of any age with dependent minor children are entitled to three-fourths of the primary annuity for themselves and 50% for each eligible child. If a worker leaves no other survivors, his parents 65 years of age and over, wholly dependent upon him, are each entitled to 50% of the primary benefits. A lump sum not exceeding six times the primary annuity is paid when no eligible dependent survives.

Maximum benefits permissible under the act are either double the primary insurance benefits, 80% of average wages, or \$85, whichever is the least, while the minimum is \$10 monthly. Earnings of \$15 or more per month automatically stop the benefits during the month they are earned. All the above benefits are paid to or on behalf of insured workers who earned at least \$50 in one-half of the calendar quarters elapsing between the end of 1936 and the time of death or retirement, or at least in six such quarters. Orphans and widows are entitled to benefits if the worker had earned \$50 in six of the 12 quarters immediately preceding his death. The 1939 changes also halted the scheduled increase in the taxes for the three years 1940-42, keeping them at 1% each for employers and workers for this period.

By Oct. 31, 1940, 320,000 claims for old age and survivors benefits were received in Washington. The beneficiaries receiving monthly benefits by that time reached 185,000, while approximately 25,000 were being added monthly. Of the new beneficiaries, approximately one-half were aged workers, one-seventh aged wives and one-third orphans and younger widows of deceased workers. Benefits averaged about \$22 monthly for a single

aged male worker, \$36 for aged couples, \$35 for a widow with one child and \$48 for a widow with two children. Total benefits paid since the inception of the program amounted to \$41,809,000 by Sept. 1, 1940, when the reserves of the system reached \$1,893,000,000.

Railroad Retirement Act.—Under the second national system of old age protection, the Railroad Retirement act, 147,123 pensions and annuities of various types were in force on Sept. 30, 1940. The average benefit on that date amounted to \$65.55 for employee annuitants, \$58.73 for pensioners, \$32.88 for survivor annuitants and \$35.97 for death benefit annuitants. Expenditures for Sept. 1940 amounted to \$10,069,473. From 1937, when the act first became operative, to Oct. 1, 1940, \$338,154,000 were expended in benefits and \$412,869,000 collected in contributions.

Public Assistance.—Through the federal-state assistance programs for the aged, there was spent a total of \$314,603,570 during the first eight months of 1940. This compared with a total of \$284,607,293 spent in the same period in 1939. In Aug. 1940, the 51 jurisdictions operating under approved plans aided 2,007,537 aged, representing 25.3% of the population over 65, at a cost of \$40,399,949. The average grant was \$20.12 per person per month as against an average of \$19.43 in Aug. 1939. The great disparity in the state averages continued, California having paid an average of \$37.93 in Aug. 1940, while Arkansas paid but \$7.22. Seven states paid average grants of less than \$10 during that month. Because of this situation, discussion regarding changes in this phase of the Social Security act centred during 1940 on larger proportional national subsidies to the poorer states.

The 42 jurisdictions with approved plans for aid to dependent children assisted 820,484 children in 339,508 families during Aug. 1940 at a cost of \$10,929,667, or an average of \$32.19 per family. The number of aided children increased 13.9% over Aug. 1939, and the monthly cost 16.8%. The average state grants ranged from \$11.45 in Arkansas to \$57.55 in Massachusetts. Alaska, Connecticut, Illinois, Iowa, Kentucky, Mississippi, Nevada, South Dakota and Texas did not operate approved programs that month. The approved plans for the needy blind in 43 jurisdictions spent \$1,132,627 in Aug. 1940 on 48,136 persons, or an average of \$23.53. The monthly cost represented a rise of 8.2% over Aug. 1939, while the number of recipients rose 6.3%. Here, too, the disparity in average payments was considerable—from \$8.02 in Mississippi to \$48.05 in California. Lacking approved programs for the blind in Aug. 1940, were Alaska, Delaware, Illinois, Kentucky, Missouri, Nevada, Pennsylvania and Texas.

A decline in the popularity of the panacea programs for the aged was clearly evident during 1940. Pension utopias played but a small role in the 1940 elections.

Unemployment Insurance.—In the first ten months of 1940, the 51 jurisdictions paying unemployment insurance benefits expended \$459,499,000, marking a rise of 16.6% in comparable payments for the same period of 1939. In Aug. the 51 jurisdictions expended \$51,696,768 on an average of 1,121,754 beneficiaries. Up to Nov. 1, 1940, a total of \$1,283,878,000 was spent in benefit payments. On Sept. 1, 1940, the states had a reserve of \$1,799,000,000. Of the benefits for total unemployment paid during the second quarter of 1940, 44.9% was for less than \$10, 29.8% between \$10 and \$14.99 and 25.3% for \$15 and over. A study of the operation of the unemployment insurance systems in 1939 revealed that an average of \$84.24 was paid out during the year in 34 jurisdictions. The average duration of payments in 11 states ranged from 8.3 to 13.6 weeks. The 1939 benefits represented 54 cents of every dollar collected during that year.

The federal system of unemployment insurance for railroad

workers spent \$1,026,485 during Sept. 1940. From its inauguration in July 1939 through Sept. 1940 this plan expended \$17,530,400 in benefits, leaving a balance of \$87,317,000 in its account.

Health Insurance.—After months of deliberation by experts and students, the model health insurance bill of the American Association for Social Security was completely revised and presented before the New York legislature. U.S. Senator Arthur Capper of Kansas introduced the federal-state measure based on the revised bill in Congress. Other medical aid bills were introduced in congress as well as in several state legislatures. (See also CHILD WELFARE; LAW [CASE]: *Social Security*; LEGISLATION: *State*; UNITED STATES: *Social Security*.) (A. EP.)

Great Britain.—Changes were made in the system of national insurance during the year 1940 by the Old Age and Widows' Pensions act, 1940, which became fully effective in August. Under its provisions supplementary pensions to old age and widow pensioners according to need became payable for the first time; and the age at which contributory pensions are payable to women was reduced from 65 to 60.

In arriving at the amount of a supplementary pension the assistance board assesses the need of the pensioner as if the household had no resources, and then deducts the resources of the whole household (including the pension), though resources in the nature of sick pay, disability pensions, national health insurance benefit, etc., are not taken fully into account. The basic rate for a married couple not being members of a larger household is 31s. if only one of them is a pensioner and 32s. if both are, and for a person living alone 19s.6d.; in each case the main pension is made up to the named sum, subject to adjustment on account of rent or special circumstances, and to further increase during the 22 weeks of winter. These supplements make it unnecessary for needy pensioners to apply to public assistance committees and relieve local authorities to the extent of some £5,250,000 a year.

To help meet the cost of these additional benefits the act increased the ordinary rates of contribution by 2d. a week for men and 3d. for women, of which employers pay 1d. in each case. This was expected to meet the cost (about £8,000,000 a year) of lowering the pension age for wives and insured women.

Unemployment Insurance.—The 1939 report gave the income of the unemployment fund, general account, as £67,283,926 (an increase for the year of over £1,388,000) and expenditure as £50,682,348 (a decrease of over £11,637,000), bringing the balance to £57,555,000. In view of the likelihood of there being serious unemployment following the close of hostilities, £37,000,000 of this were allocated to the repayment of debt, thereby reducing the annual debt charge by about £1,100,000, which enabled an increase in benefit of 1s. per week to be made for each of the first two children of unemployed persons. The agricultural accounts income exceeded expenditure by over £623,000; the balance rising to £3,397,222; benefit for dependent children was thereupon increased as under the general scheme, and the maximum limit of total benefit raised from 33s. to 35s. per week which, by the act passed in July 1940, was further increased to 41s.

In February the minister of labour and national service announced an expansion of the ministry's training organization; 14 centres, training 8,000 men, were then active; during 1940 others were added and over 1,000 additional instructors engaged; and it was hoped that an annual output of over 100,000 trained men would be obtained from unemployed over military age or unacceptable to or reserved from military service.

In July a new Unemployment Insurance act received the royal assent; weekly rates of benefit were raised by 2s. for young men and young women (aged 18–20) and all women in the agricultural

scheme, and by 3s. for all others (aged 21-64); further, benefit became payable on unemployment for two days, instead of three as hitherto, out of any consecutive six days. The additional cost was met by an increase in the weekly contribution of 1d. ($\frac{1}{2}$ d. in the agricultural scheme) from each party, viz., employer, worker and exchequer. The act also extended the insurance scheme to most non-manual (black-coated, or white-collar) workers whose remuneration did not exceed £420 a year (previously £250), and included certain wartime safeguards, withholding benefit from persons disregarding defence regulations relating to employment. At the end of the year a government bill was introduced substantially modifying the household means test for unemployment assistance and supplementary pensions.

The latest available statistics showed that in Sept. 1940 the total number of persons registered as wholly unemployed was 613,671 as compared with 1,052,218 in Sept. 1939. (L. H. D.)

Societies and Associations: *see* under specific name.

Softball. There were in 1940 an estimated 2,500,000 players among young men and women, representing some 110,000 teams. Played on a diamond about one third smaller than a baseball infield, the game is faster, while the ball is larger and not as hard as a baseball, and the bat is smaller. The Amateur Softball Association of America is the governing body of the amateurs.

The 1940 championship tournament of the association was similar to a small world's series in baseball. The annual title was won by the Rochester, N.Y., team, winning from the South Bend, Ind., aggregation. Harold Gears hurled for the victors and allowed only three hits.

Teams of women players also became more numerous. They played the game with as much speed and skill as the men. The association's title for women's teams was won by the Phoenix (Ariz.) Ramblers, defeating the Koch Furniture team of Cleveland, Ohio. (J. B. P.)

Soil Erosion and Soil Conservation.

Some of the warring nations in 1940 recognized soil conservation as necessary to the national welfare. Forced to protect all possible sources of home food supply, the German reich in the early spring decreed that all topsoil removed in the construction of highways, airports, fortifications and new industrial plants be transported to agricultural districts deficient in topsoil. In many of the British possessions, notably Australia, Canada, New Zealand and South Africa, conservation operations went on despite war demands. Throughout the world, erosion was recognized as a menace to national welfare, and unified conservation programs were being developed on every continent.

In North America, where erosion by wind and water has reached immense proportions, conservation operations were carried out on the largest scale the world has ever known.

An extensive mechanism for conservation of farm and range lands in the United States is the soil conservation district. Thirty-eight states have enacted laws enabling farmers to establish by popular election soil conservation districts, which as distinct units of local government are clothed with the power and authority to plan and carry out erosion control operations. The district is a democratic organization. The district officials, a majority of whom are elected by farmers from among their own numbers, administer the affairs of the district: they determine work priorities, approve farm plans, engage the assistance of local, state and federal agencies and perform the other duties related to the job.

By Dec. 1940, there were 428 soil conservation districts in 36 states embracing an area of some 260,000,000 acres. Where resources were available, the districts received upon request such assistance as technical personnel, materials, equipment and labour for installing erosion control measures and devices from federal and state agencies. Some states made special appropriations for assisting these districts. Professionally trained personnel engaged in the mapping of soils and in developing farm conservation plans were supplied by the Soil Conservation service. In many states labour was provided by the Work Projects administration, the National Youth administration and the Civilian Conservation corps.

The Soil Conservation service was working in more than 500 selected areas throughout the country demonstrating effective erosion control practices. Also under the submarginal land utilization program, over 11,000,000 ac. of land unsuited for crop production were purchased from farmers and ranchers, retired from cultivation, and developed as pasture, range, forest, wildlife refuge and recreational areas. The government also made loans to farmers in semi-arid areas with which to set up water facilities, such as wells, pumps, stock-tanks and similar aids to good land use.

Altogether some 120,000 farms, covering 30,000,000 ac. in demonstration projects, CCC camp areas and other work areas, were in 1940 being treated to bring about complete erosion control. As a further encouragement to soil conservation, the Agricultural Adjustment administration made payments to farmers for adopting selected individual conservation measures. There were some 6,000,000 farmers participating in the crop adjustment program. From 1934 to 1940 farmers co-operating with the AAA have converted more than 30,000,000 acres from soil-depleting to permanent soil-conserving crops.

Throughout the United States, erosion-inducing practices, such as single cropping, up-and-down hill farming, overgrazing, and the burning of woodland and range lands, were replaced by soil-conserving practices. Soil-conserving crop rotations went into effect on an increasing area of land. Contour strip cropping, contour cultivation, reforestation, terracing, range development, meadow stripping, gully control and similar measures supplanted the more antiquated, destructive farming methods.

Canada.—Erosion in Canada reached its greatest proportions in the prairie provinces of Manitoba, Saskatchewan and Alberta. The problem, wind erosion, is somewhat the same as that which exists on the northern great plains of the United States. The prairie provinces passed legislation designed to help farmers and ranchers check wind erosion and correct land use conditions responsible for severe soil blowing. Alberta began in 1927 with the passage of an act providing for the removal of submarginal lands from cultivation. In recent years a series of laws have been passed by the three prairie province parliaments favouring conservation. Farmers received help in securing drought-resistant grasses and trees for shelterbelts and in developing water facilities for livestock and domestic uses. The conservation program in Saskatchewan resembled the program being carried out through the soil conservation districts in the United States.

In Mexico, erosion problems were mostly local in nature, some lands being excessively eroded while others were in excellent condition. The ancient custom of farmers living in villages and cultivating and grazing near-by areas explains this condition.

In South America, where some of the first outstanding erosion control devices in history were developed by the Incas—notably terracing and water diversion systems, whose monumental remains still stand—erosion by both wind and water reached such proportions as to attract governmental attention. In the central region of Chile there is much erosion in the arid coastal sections where land is not irrigated and where the slopes of the coastal mountains are exposed to the intense winter rains. Gullies are characteristic of the coastal slopes and of the wheat-growing sections, where clean plowing after harvest is practised. Excessive erosion in the rich agricultural areas in the south of Chile were reflected in greatly reduced crop yields. Experiment stations were established to study the erosion problem.

Recognizing the serious erosion problem in the Argentine, the national government on March 29, 1940 began an intensive educational campaign among the farmers "concerning the most adequate methods of cultivation leading to the conservation of fertility of the soil and the prevention of erosion or impoverishment." On July 17, 1940 the president of Colombia issued a decree creating protected forest zones on lands located at the headwaters of river basins, streams and ravines, and on margins and slopes with an incline greater than 40%. In the forests of the protected zones, penalties were levied for unauthorized felling of trees, grubbing or burning. In other South American countries erosion was recognized as a major problem but little national action was taken to prevent soil decline.

Europe.—In northwestern Europe, well distributed rainfall, lack of torrential rains and centuries of careful husbandry have preserved the fertility of the soils remarkably. The amount of erosion which does appear there is negligible: some sheet erosion in the high rainfall areas of Scotland and Wales, gully erosion in certain moraine areas of north Germany and on the slopes of the hill country, sheet erosion in the fine-sand areas in Brandenburg, and the shifting dunes in the Low Countries.

One of the most stupendous land reclamation projects ever undertaken is the draining of the Zuider Zee by the Dutch. Prior to the invasion by the Germans, more than 180,000 acres had been reclaimed and about one-third of it had been leased to farmers. On all reclaimed areas erosion control devices were established and the farmers were required to maintain them.

Erosion has for centuries exacted a heavy toll in some of the Mediterranean basin countries, due to the primitive methods of farming, the almost total absence of forests, and neglect of elaborate and ancient systems of stonewall terracing.

The destruction of vegetation and water conservation devices, such as cisterns and catchment basins, has resulted in the excessive depletion of soils in African lands bordering the Mediterranean.

Outside of Italy and the Italian and French mandates in northern Africa, very little effort at erosion control was made. In Italy a stupendous task of land reclamation and soil conservation has been going on since 1930. It was estimated, prior to Italy's entrance into the war, that one-third of the country would be improved under the Bonifica Integrale by 1944.

Centuries of deforestation and slope cultivation in Greece, together with the raising of goats, of which there are some 5,000,000 in the mountain regions, have resulted in one of the most serious erosion problems in the old world. The Greek government has taken steps to reduce the goat population systematically; reforestation and the channelling of flood streams are other major conservation devices.

Wind erosion is a serious problem on the plain of Hungary. Rapid deforestation of the Transylvanian Alps since the war of 1914-18 has contributed to the frequent flooding of the River Tisza and its tributaries. Erosion is progressing in the Rakovnik area of Bohemia and in the basin of the Borsary river in the Carpathian mountains.

Shifting sand dunes are a menace to agriculture in East Prussia and Poland. In eastern Poland, central Russia and the Ukraine, sheet and gully erosion are quite severe, while wind erosion on the steppes and the expanding area of drifting sand in south-central Asia add to the erosion problems of the Union of Soviet Socialist Republics. With extension of mechanized co-operative farms in semi-arid sections, the problem of wind erosion has greatly increased. Chief erosion control measures adopted by the soviet are the planting of shelterbelts and the development of drought-resistant grasses adaptable to the dry plains.

Orient.—The orient offers some of the most tragic results of erosion and some of the best examples of soil conservation. The land around the headwaters of the Yellow river in China is the most severely eroded region in the world, while the picturesque terraced hillsides of western China in the drainage of the Yangtze river, as well as terraced slopes in Japan, illustrate conservation at its best.

Continuous overgrazing has been largely responsible for much of the catastrophic erosion that scars the foothills of the Himalayas. Due to the lack of vegetation in the Punjab, the hills give rise to many violent torrents which, during summer floods, transport and deposit large quantities of silt and debris on the agricultural lands, causing considerable damage at the foot of the hills. Sauj Kas in Chakwal Teksil of Jhelum district is one of the destructive streams where counter-erosion works have started. On March 13, 1940 the central board of irrigation recommended to all provincial and state governments that they "develop and extend the most suitable local machinery to deal with further denudation" of Indian uplands.

For decades the Japanese have applied elaborate and systematic conservation methods so that in 1940 accelerated erosion was practically nonexistent on the farm lands of Japan.

Africa.—Countries of east Africa, where there is a similarity of topography, climate and customs, have about the same erosion problems.

In west Africa erosion has not been a serious problem. Primitive farming methods, the unsuitability of the region to white settlement, and the relatively small amount of livestock grazing due to the prevalence of the tsetse fly have preserved much of the tropical zone.

Australia.—In Australia, erosion by both wind and water has caused tremendous damage. Severe water erosion obtains in the Queensland cotton belt. Sheet erosion is widespread in Tasmania; the southern apple-growing districts are affected locally by severe water erosion. Wind erosion occurs in the semi-arid pastoral belt where the states border upon the central arid region of Australia and in the "bush country" of South Australia. Drifting of light sandy soils occurs on a large scale in some districts of South Australia, Western Australia, Victoria and New South Wales.

New Zealand.—The destruction of vegetation by high winds and overgrazing in the Kaimanawa mountains of New Zealand has led to severe erosion. (See also DROUGHT; DUST STORMS.)

South Africa, The Union of. Area, 472,550 sq.mi. (incl. Walvis bay, 430 sq.mi.);

pop. (est. June 30, 1939), 10,160,000 (Europeans, 2,116,500; native, 6,997,500; coloured, 814,800; Asiatic, 231,200). Chief towns (pop. census 1936): Cape Town (344,223); Johannesburg (519,384); Durban (259,606); Pretoria (128,621); Port Elizabeth (109,841). Governor general: Rt. Hon. Sir Patrick Duncan; languages: English, 39%; Afrikaans, 56%; religion: European population: Christian (Dutch Reformed Churches, 55%; Anglican, 19%; Methodists, 6%; Presbyterians, 5%).

History.—The union is a self-governing dominion of the British commonwealth of nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South West Africa is administered under mandate as an integral part of the union. The seat of the government is at Pretoria; the seat of the legislature is at Cape Town.

The danger of a rebellion similar to that of 1914 was averted by the prudence of the opposition leaders and the prompt though lenient steps of the government against nazis and local black-shirt sympathizers in the union and South-West Africa. General J. B. M. Hertzog's followers joined the more numerous Nationalist following of Dr. D. F. Malan in a Reunited Nationalist or People's party. The party's demand for republican independence was weakened by memories of old feuds and the Hertzogites' lack of enthusiasm for secession or indeed controversy in wartime. It failed to reunite all the Afrikaners, a large and increasing number of whom supported Smuts side by side with the British section and the politically ineffective non-European majority. During the 1940 sessions (January-May and August-September), General J. C. Smuts had an average majority of 8 in the reconstituted senate and 20 in the assembly, while his policy was endorsed at a general election in South-West Africa (United party, mainly Afrikaners, 10; Nationalists, with German support, 2).

The German invasion of the kindred Netherlands left Nationalist opposition unchanged (May), while the entry of Italy into the war and the collapse of France (June) convinced them that Great Britain was doomed. Nazi aggression and the successful British stand lent weight to Smuts' plea that "neutrality is dead," and that the union must support Great Britain in a war which would decide the fate of Africa, a continent in which the union aspires to play a leading role. The assembly twice rejected Hertzog's motion for a separate peace (Jan. and Aug. 1940).

By the end of 1940 the union had not sent an expeditionary force to Europe as it did in the war of 1914-18, but had reorganized its defence force, developed home supply and raised a large volunteer mobile defence force for service "anywhere in Africa." On June 11 it declared war on Italy, sent its air and mobile forces into action on the Kenya-Somaliland frontier and stationed troops on its own eastern border to safeguard, if necessary, Portuguese Delagoa bay, the natural outlet of Transvaal traffic to the Indian ocean. It subscribed generously to funds for the aid of the British government and people and welcomed evacuated British children in spite of Nationalist grumbling at this alleged attempt to strengthen the British element.

The government controlled prices, converted a large loan from 5% to 3½% and set up an Industrial Development corporation, financed in the first instance and controlled by itself, to encourage the secondary industries which were already co-operating with recruiting to check unemployment. The British government was buying the wool clip for the duration of the war and one year after and giving analogous help to maize and dairy producers, while the union and British governments together were helping fruit growers. Estimated revenue for 1940-41 was £54,902,000, including a small surplus, and expenditure, £57,255,000 including £14,000,000 for war purposes; nevertheless, more was to be spent than in the previous year on social services, including native education. The gap was to be filled mainly by £2,000,000 from loan account and a special levy on the gold mines in return for leave to sell gold at the enhanced world price which had risen from 148s. to 168s. per oz. since the outbreak of war.

No major government measure had to be shelved in spite of systematic Nationalist obstruction, though the "guillotine" had to be used for the first time to secure the passing of the War Emergency bill, condoning executive acts during the first four months of the war. The Electoral Laws Amendment act, long overdue, removed some of the handicaps on urban as against rural constituencies. (E. A. Wr.)

Education, 1937.—State and state-aided: European schools, 4,471; scholars, 381,550; native schools, 4,850; scholars, 546,225; higher, average number of students, 8,707.

Banking and Finance.—Revenue, ordinary (est. 1940-41), £54,902,000; expenditure, ordinary (est. 1940-41), £65,061,562; public debt (March 31, 1940), £290,400,000; notes in circulation (Feb. 2, 1940), £19,867,758; gold reserve (Dec. 31, 1939), £29,803,198; exchange rate (1938), £100.5 S.A.—£100 sterling.

Trade and Communication.—External trade (exclusive of goods in transit and of gold bullion and specie): imports (total, 1939), £91,341,108; (Jan.-June 1940), £53,566,842; exports (domestic, 1939), £34,143,132; (Jan.-June 1940), £18,898,233. Communications and transport: roads fit for motor traffic (1937-38), 85,428 mi.; railways, including S.W. Africa (March 31, 1939), 13,642 mi.; airways, including S.W. Africa (1938-39); passengers carried, 37,053; freight, mails and luggage carried, 4,468,903 lb.; mileage flown, 1,988,664; shipping (1939) entered, 6,040; net tonnage, 24,699,753; cleared, 6,017; net tonnage, 24,627,778. Motor vehicles licensed (Dec. 31, 1939): cars and taxis, 318,628; buses, 1,763; vans and lorries, 50,249; tractors, 1,087; cycles, 23,452; wireless receiving set licences (1938), 189,321; telephones, instruments in use (1938), 175,711.

Agriculture, Manufactures, Mineral Production.—Production (in metric tons): gold (1939), 12,819.344 fine oz.; diamonds (1939), 1,269,828 metric carats; maize (est. 1939-40), 1,886,910; coal (1939), 21,524,890; sheep, number (Aug. 31, 1938), 39,001,481; cattle, number (Aug. 31, 1938), 11,371,733; wool (est. 1940-41), 122,954; wheat (1938-39), European cultivation, 465,200; cane sugar (1938-39), refined, 472,600; iron ore (metal content) (1938), 320,000; pig iron and ferro-alloys (1938), 294,400; steel (1937), 284,000; silver (1938), 1,135,374 fine oz.; manganese ore (metal content) (1938), 238,600; chrome ore (chromic oxide content) (1938), 79,400; asbestos (1938), 21,900; wine (1937-38), European cultivation, 347,091 hectolitres; tobacco (1937-38), European cultivation, 9,236; potatoes (est. 1939-40), European cultivation, 154,500; oats (1937-38), European cultivation, 86,158; barley (1937-38), European cultivation, 25,809; mohair (1938), export, 1,900; copper (smelter production) (1938), 11,100; ground-nuts (est. 1939-40), European cultivation, 9,680; benzol (1938), 1,900; superphosphates of lime (1937), 164,000. Industry and labour: (census, 1936-37) establishments, 9,987; employees, European, 140,203; others,

192,565; value of gross output, £172,863,087; value of net output, £79,931,813. Employment index, European (average, 1925=100), average, 1939, 177.0.

South America: see ARGENTINA; BOLIVIA; PERU; ETC.

South Australia. A state of the Australian commonwealth, 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. The state governor is Sir Charles Malcolm Barclay-Harvey, K.C.M.G. Population (est. Dec. 31, 1939) 597,045. Chief town and capital (pop. Dec. 31, 1939), Adelaide (322,990).

History.—Since the outbreak of war, large commonwealth government contracts had been let for the construction of extensive defence works in South Australia. The Imperial Chemical Industries' works at Outer Harbour reached production stage with output undergoing a testing period. The principal products are soda ash, bicarbonate of soda and calcium chloride and when full production was achieved the works were expected to supply the whole of the Australian market.

During the year the barrages at the mouth of the river Murray which stretch across various arms of the river were completed. This work, which had taken five years, marked the completion of the River Murray scheme initiated 25 years before and which cost a total of £A12,000,000.

The government amended the regulations under the Education act to exempt all pupils up to the age of 15 years from the payment of fees for high school, junior technical schools and day school education. Free education which had been afforded to all school children up to the compulsory school-leaving age of 14 was thus extended for 12 months.

Finance.—In 1939-40: revenue, £A12,755,648; expenditure, £A12,918,376; debt outstanding (Dec. 31, 1939) £A111,167,864.

Communications.—Roads (March 30, 1940) 23,032 mi. fit for motor traffic; railways (1939) government 2,558 mi. Motor vehicles licensed (Dec. 31, 1939): cars 59,345; trucks 25,740; cycles 9,492. Wireless set licences (Dec. 31, 1939) 120,584.

Agriculture and Manufactures.—Wheat (1939-40) 40,984,000 bu.; barley (1939-40) 9,250,000 bu.; grapes (1938-39) 150,608 tons; currants (1938-39) 191,381 cwt.; wool 1938-39) 102,888,121 lb.; butter (1938-39) 20,594,223 lb. Industry, 1939: factories 2,067; employees 43,371; gross value of output £A35,005,254; unemployment (1938-39) 9.4%. (W. D. MA.)

South Carolina is an Atlantic coast state of the United States and one of the original thirteen. It has an area of 30,989 sq.mi., including almost 500 sq.mi. of coastal waters. Population 1940, 1,899,804, a decennial increase of 9.3%; Columbia, the capital, 62,396; Charleston, 71,275. Urban population 24.5%, as against 21.3% in 1930.

History.—Gov. B. R. Maybank continued to urge state police to supplement antiquated local law enforcement, diversion of part of abundant road support from gasoline tax to general purposes so as to avoid increasing general taxes, and a constitutional convention to modernize the constitution especially as to taxation. A few K.K.K. parades and whippings brought several prosecutions. South Carolina voted 95% Democratic in the 1940 national election, giving Roosevelt 95,470 votes and Willkie 4,360. The people voted for biennial (instead of annual) legislative sessions and for prohibition, actions to be ratified or ignored by the 1941 legislature. Large army training camps were located at Columbia and Spartanburg. A coastal hurricane of Aug. 11 killed 35 or 40 persons and wrecked about \$3,000,000 worth of property.

Education.—Whites in public schools in 1938-39, 266,882; Negroes 220,728; expenditures, respectively, \$15,952,094 and \$2,502,437. National Youth administration aided college students in 1939-40, \$191,265, and high school students, \$232,416.

Charities, Corrections and Social Legislation.—On June 30, 1940, the state hospital (for insane) contained 4,529 patients and 807 more were on parole. The state penitentiary that day held 1,338 convicts. Many prisoners of all grades (except those personally desperate) are on county chain gangs. Executions for the year ending June 30, 1940, 5 (previous year 10). The department of public welfare distributed (1939-40) in money and supplies to children, the aged, the blind, etc., \$6,030,635, of which all but \$1,413,600 came from federal funds. The S. C. Unemployment Compensation commission paid \$2,327,164 in benefits in same 12 months. On June 30, 1940, 6,308 miles of paved highways were in use and 290 miles under construction.

Finance.—The state government's receipts year ending June 30, 1940, totalled \$66,197,575. This included about \$18,000,000 raised by fees and taxes for general purposes; \$13,117,313 gasoline taxes for roads; about \$4,008,000 from the federal government and large sums borrowed to pay off maturing notes or bonds. The court's annulling the attempted transfer of \$2,000,000 gasoline taxes from roads to general purposes as violating the pledge of those taxes for service of the road bonds (though the tax income had risen much above that necessity) left a deficit in general funds of about \$2,809,000. Total state debt for highways June 30, 1940, was \$62,912,534 (of which \$16,903,534 was for reimbursing counties). Other state debt equalled \$7,926,137. Federal internal revenues from S. C., year ending June 30, 1940, totalled \$10,955,057. Exports totalled \$9,270,091 and imports \$7,866,492, duties on the latter being \$1,358,635.

Agriculture and Manufactures.—Agriculture somewhat improved, but lagged behind manufacturing. The total value of crops in 1940 was \$121,624,000, being 6% above the five-year average. The 970,000 bales of cotton showed the largest yield per acre in the state's history, as was true also of tobacco. Wheat (the largest crop on record) equalled 2,688,000 bu. and corn 24,304,000 bu. Nine counties had fewer farms than in 1930 and 13.7% of all farms had electric service. In 1940 6,676,000 ac. of forest were under co-operative state and private protection. The two federal forests totalled 2,016,234 ac., 658,236 being federally owned. Investment in manufactures totalled \$406,211,667, textiles representing \$204,103,617; value of products \$446,083,566 and \$290,094,123, respectively; wages (not including salaries), \$100,021,714 and \$73,475,819, respectively. Employment of approximately 25,000 men on government camps and power developments and decided business revival in general greatly reduced unemployment. (D. D. W.)

South Dakota, west north central state, admitted to the union Nov. 2, 1889, is generally called the "Coyote State." Area, 77,615 sq.mi. Population (1940 census), 642,961; urban pop., 158,087; rural pop., 484,874. Capital, Pierre (pronounced "Peer"); pop., 4,322. Chief city, Sioux Falls; pop., 40,832. Indian pop. (1939), 28,578.

History.—In general election of Nov. 5, 1940, Republicans retained complete control of state government and state's two congressional seats. Willkie carried the state 177,065 to 131,362 for his largest percentage in the nation. The state officials elected in Nov. 1940 were: governor, Harlan J. Bushfield*; lieut. gov., A. C. Miller; secretary of state, Miss Olive A. Ringsrud*; state auditor, W. W. Warner*; state treasurer, W. G. Douglas*; commissioner of schools and public lands, Earl A. Hammerquist*; attorney-general, Leo A. Temmey*; supt. of public instruction, John F. Hines*; public utilities commissioner, C. L. Doherty*;

judges of supreme court, H. B. Rudolph* and St. Clair Smith* (* shows re-election).

Formal programs were held to mark the centenary of the first Catholic services in the trans-Missouri region in South Dakota by Father Christian Hoecken in June 1840, and the centennial of the first Protestant sermon in the state by Dr. Stephen R. Riggs in Sept. 1840.

Statistics.—The school census for 1940 was 186,251; school enrolment, 136,447. On June 30, 1940, the state's bonded debt was \$43,294,000. Total receipts, \$29,704,910.14; disbursements, \$26,845,889.12. Total crop value, \$85,322,000.

South Dakota's rank among states in 1940 in crop production was: second in durum wheat; third in barley and rye; fourth in other spring wheat, sweet sorghum and wild hay; fifth in flax; sixth in oats, and thirteenth in corn and all wheat.

The mineral production, principally gold from Homestake mine (Lead, S.D.), was more than \$20,000,000. (L. K. F.)

Southern Rhodesia: see RHODESIA.

South Polar Regions: see EXPLORATION AND DISCOVERY.

South Sea and Equatorial Islands. Howland island lies in the Pacific ocean, approximately 1,870 mi. southwest of Honolulu, in latitude 0°-48'-06" N. It was surveyed in 1872 by the U.S.S. "Narragansett" and found to be about 2 mi. long, ½ mi. wide, 20 ft. above sea level at its highest elevation, of coral formation and with a fringing reef.

Baker island is in the Pacific ocean in latitude 0°-13'-30" N., longitude 176°-28'-14" W., approximately 1,880 mi. southwest of Honolulu, and within 13 nautical miles of the equator. It is of coral formation, about 1 mi. long east and west, and ¾ mi. wide, surrounded by a coral platform reef 200 to 400 ft. wide. Its highest point of elevation above sea level is 20 ft.

Jarvis island is in the Pacific ocean, approximately 1,500 mi. south of Honolulu, in latitude 0°-22'-37" S., longitude 160°-01'-37" W., 23 mi. south of the equator. It is of sand and coral formation, approximately 2 mi. long and 1½ mi. wide, and about 20 ft. above sea level at its highest point.

These three islands were settled in 1936, after having been uninhabited for many years. Representatives of the department of the interior placed four young Hawaiians on each island to maintain sovereignty of the United States and to obtain meteorological data essential to commercial aviation in the Pacific. United States citizens of Hawaiian ancestry were selected because of their adaptability to prevailing conditions and their proximity to the islands. The scarcity of vegetation and the absence of drinking water make it necessary to transport food, water and other supplies from Honolulu. This is accomplished by quarterly expeditions to the islands by coast guard cutters.

Canton island is the largest and most northerly of the Phoenix islands. It is approximately 1,850 mi. southwest of the Hawaiian group in latitude 2°-48'-58" S., longitude 171°-42'-41" W. It is a coral atoll containing a narrow strip of land varying from 50 to 600 yd. in width, enclosing a lagoon about 9 mi. long and 3 mi. wide at the west end. The rim varies in height from 10 to 20 ft. and is broken only by three or four lagoon entrances.

An air base has been established on Canton island by Pan American Airways in connection with its service from California to New Zealand. A hotel and other necessary facilities are now in operation, and regular aviation service was started with the first air mail flight from California on July 12, 1940. With the agreement of the state department, the interior department and the Civil Aeronautics authority, a member of the Pan American staff on Canton island has been designated acting field representative

of the interior department, serving without compensation. The Hawaiian colonists were evacuated Oct. 8, 1940.

Canton and Enderbury islands are under the joint control of the United States and Great Britain, under an agreement completed in 1939 between the two governments, providing for the common use of the islands for international aviation and communication for a period of 50 years. (R. EM.)

South-West Africa: *see* MANDATES; SOUTH AFRICA, THE UNION OF.

Sovereigns, Presidents and Rulers.

The following list includes the names of those holding chief positions in their countries at the beginning of 1941.

Country	Name and Office	Accession
Afghanistan	Muhammed Zahir Shah, King	1933
Arabia, Saudi	Abdul Aziz ibn Sa'ud, King	1926
Argentina	Ramón S. Castillo, Acting President	1940
Australia	Lord Gowrie, of Ruthven, Governor General	1936
	Robert G. Menzies, Premier	
Belgium	Leopold III, King (German occupation)	1934
Bhutan	Yigme Wangchuk, Maharaja	1926
Bolivia	General Enrique Penaranda, President	1940
Brazil	Dr. Getulio Vargas, President-dictator	1930
Bulgaria	Boris III, King	1918
	Bogdan Philoff, Prime Minister	
Burma	Sir Archibald D. Cochrane, Governor	1936
	U. Saw, Prime Minister	1940
Canada	Earl of Athlone, Governor General	1940
	W. Mackenzie King, Prime Minister	
Chile	Pedro Aguirre Cerda, President	1938
China	Lin Sen, Chairman of National Gov't	1932
	Gen. Chiang Kai-shek, President of Executive Yuan	1939
Colombia	Dr. Eduardo Santos, President	1938
Costa Rica	Rafael A. Calderon Guardia, President	1940
Cuba	Col. Fulgencio Batista, President	1940
Denmark	Christian X, King (German occupation)	1912
Dominican Rep.	Manuel de Jesus T. de la Concha, President	1940
Ecuador	Carlos Arroyo del Rio, President	1940
Egypt	Farouk I, King	1936
	Hussein Sirry Pasha, Premier	
Eire	Dr. Douglas Hyde, President	1938
	Eamon de Valera, Premier	
Finland	Risto Rytty, President	1940
France	Henri Philippe Pétain, Premier and Chief of State	1940
Germany	Adolf Hitler, Fuehrer and Reich Chancellor	1933
Great Britain	George VI, King and Emperor	1936
	Winston Churchill, Prime Minister	
Greece	George II, King	1935
Guatemala	Gen. Jorge Ubico, President	1931
Haiti	Stenio Vincent, President	1930
Honduras	Gen. Tiburcio Carias Andino, President	1933
Hungary	Admiral Nicholas Horthy, Regent	1920
	Count Pal Teleki, Premier	
Iceland	Christian X, King (British occupation)	1912
India	Marquess of Linlithgow, Viceroy, Governor General	1936
Iran	Reza Pahlevi, Shah	1926
Iraq	Feisal II, King (Regency)	1939
Italy	Victor Emmanuel III, King	1900
	Benito Mussolini, Premier, Chief of Gov't, Sec'y of State	
Japan	Hirohito, Emperor	1926
	Fumimaro Konoye, Premier	
Liberia	Edwin Barclay, President	1930
Liechtenstein	Franz Joseph II, Sovereign Prince	1938
Luxembourg	Charlotte, Grand Duchess (German occupation)	1919
Manchoukuo	Henry Pu Yi, Emperor Kangle	1934
Mexico	Manuel Avila Camacho, President	1940
Monaco	Louis II, Prince	1922
Morocco	Sidi Maulay Mohammed, Sultan	1927
Nepal	Maharajah Sir Joodha Shamsher Jung Bahadur Rana, King	1940
Netherlands	Wilhelmina, Queen (German occupation)	1890
Newfoundland	Sir Humphrey T. Walwyn, Governor	1936
New Zealand	Sir Cyril Newall, Governor General	1940
	Peter Fraser, Acting Prime Minister	
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King (German occupation)	1905
Oman	Sir Sayyid Said bin Taimur, Sultan	1932
Palestine	Sir Harold Alfred MacMichael, High Commissioner	1938
Panama	Arnulfo Arias, President	1940
Paraguay	Higinio Morinigo, Provisional President	1940
Peru	Dr. Manuel Prado y Ugarteche, President	1939
Philippines	Manuel Quezon, President	1935
Portugal	Gen. Antonio Carmona, President	1926
	Dr. Antonio Salazar, Premier	
Rumania	Mihai, King	1940
	Ion Antonescu, Premier-Dictator	
Russia	Mikhail Ivanovich Kalinin, President	1936
	Joseph V. Stalin, Communist Secretary	

Country	Name and Office	Accession
Salvador, El	Gen. Maximiliano Hernández Martínez, President	1935
Siam (Thailand)	Ananda Mahidol, King (Regency)	1935
	Col. Luang Bipula Songgram, Premier	
Slovakia	Joseph Tiso, President	1939
South Africa	Sir Patrick Duncan, Governor General	1937
	Gen. Jan C. Smuts, Premier	
Spain	Gen. Francisco Franco, Chief of State, Prime Minister	1939
Sudan	Lt. Gen. H. J. Huddleston, Governor General	1940
Sweden	Gustaf V, King	1907
Switzerland	Dr. Ernst Wetter, President	1941
Syria, Lebanon	Henri Dentz, High Commissioner	1940
Trans-Jordan	Abdullah ibn Hussein, Emir	1928
Tunis	Sidi Ahmed II, Bey	1929
Turkey	Ismet Inonu, President	1938
United States	Franklin D. Roosevelt, President	1933
Uruguay	Gen. Alfredo Baldomir, President	1938
Vatican City	Pius XII, Pope	1939
Venezuela	Gen. Eleazar López Contreras, President	1935
Yugoslavia	Peter II, King (Regency)	1934
Zanzibar	Seyyid Sir Khalifa bin Harub, Sultan	1911
	Henry Guy Pilling, British Resident	1939

Soybeans. Urgent need for edible fats and oils gave impetus in 1940 to European and Asiatic production of soybeans, an important food and feed crop in the United States and Europe but grown in these countries only to a minor extent until a few years ago. Acreage was greatly increased in the Danube basin, the principal European production area. In Manchoukuo, the world's largest producer, government regulations compelled thorough harvesting from a smaller acreage. Manchoukuoan farmers, reports the United States agricultural attaché at Shanghai, "will have preferential rights to obtain necessities when they have complied with the government's crop collection campaign." As a result the 1940 Manchoukuoan crop of soybeans was 161,156,000 bu. from 9,454,000 ac., compared with 144,952,000 bu. from 10,827,000 ac. in 1939, the Manchoukuoan ministry of industry estimated. In the United States, the second largest producer, estimated harvest from soybeans was 81,541,000 bu. from 5,011,000 ac., compared with 87,409,000 bu. from 4,226,000 ac. in 1939. Rumania lost 80% of its soybean acreage in 1940 by the ceding of Bessarabia to Russia. The Rumanian five-year plan, published in the spring of 1940, specified the year's soybean planting at 395,360 ac., comparable with 256,000 ac. in 1939. With the loss of Bessarabia, the acreage was reduced to 54,000 ac., with an estimated yield of 704,000 bu. as against 3,532,000 bu. in 1939. No figures are available from Russia. The Rumanian government fixed the price to farmers at \$1.50 per bu. Bulgaria increased the 1940 planting to 99,000 ac., from 44,000 in 1939. The 1940 crop was estimated at 1,415,000 bu. compared with 613,000 bu. in 1939. The fixed price was \$1.81 per bu. Bulgaria announced a larger acreage for 1941 owing to increased demand from Germany. Owing to the British blockade's preventing the importation of oilseeds from Asia and Africa, Hungary increased the 1940 acreage to 12,000 ac., from 7,000 in 1939, with a 194,000 bu. crop in 1940, against 125,000 bu. in 1939. All soybeans produced in Hungary were converted into food for the army. The fixed price was raised successively

Soybean Production by Principal States, 1940 and 1939

	1940 bu.*	1939 bu.	1929-38 average, bu.
Illinois	39,420,000	45,423,000	14,784,000
Iowa	13,680,000	10,227,000	2,714,000
Indiana	10,439,000	13,062,000	4,016,000
Ohio	8,070,000	9,681,000	1,713,000
North Carolina	2,422,000	2,012,000	1,341,000
Missouri	1,067,000	970,000	746,000
Other states	5,843,000	5,134,000	2,004,000

*A bushel of soybeans weighs the same as a bushel of wheat, 60 pounds.

in 1940 from \$1.20 to \$1.44 to \$1.66 per bu. The Yugoslav crop in 1940 was estimated at 294,000 bu. from 21,000 ac., compared with 103,000 bu. from 16,000 ac. in 1939. The government-fixed price was \$1.47 per bu. An unfavourable growing season reduced production from the record acreage in the United States in 1940. (See also CHEMURGY.) (S. O. R.)

Spain, republic of southwestern Europe, a totalitarian state; capital, Madrid; area 194,200 sq.mi. (including Balearic and Canary islands); pop. (gov't est. June 1940) 26,053,230 (1930 census) 23,563,867. Chief towns (pop. est. 1940): Barcelona 1,398,942; Madrid 1,194,756; Valencia 403,126; Seville 253,203; Malaga 232,136; Bilbao 228,418. Caudillo, or chief of state: General Francisco Franco; language: Spanish; state religion: Roman Catholic.

History.—Spain's chief concerns in 1940 were socio-economic rehabilitation and the achievement of political solidarity. The promised millennium was far from achieved, and the Franco dictatorship encountered not only bitter Republican discontent but increasing Conservative dissatisfaction as well. Climaxing extensive arrests and convictions of Republicans after the nationalist victory in 1939, a decree was issued in March 1940 which outlawed Freemasonry and secret societies and declared Freemasons (as well as Communists, anarchists, etc.) subject to imprisonment and other sanctions. In that it invited retractions, this decree held promise of greater leniency, as had the provision in January for judicial review of the sentences of military tribunals. Nevertheless, 500,000 Republicans were reported under arrest at midyear and executions continued at a rate estimated as high as 20 to 30 a day. Among prominent Republicans exe-

cuted were Lluís Companys, former president of the Catalanian republic and Julian Zugazagoita, interior minister in the Republican government of Dr. Juan Negrín. Of Republican refugees in France, an estimated 340,000 had been repatriated by March, while thousands migrated to American countries, especially Mexico, which, in an agreement signed with France and approved by the axis powers, undertook to promote the transfer of the remaining 80,000 or more to the western hemisphere.

Domestic politics were further complicated by the problem of reconciling the divergent groups supporting the Franco government: the fascist F.E.T. (*Falange Española Tradicionalista*) and the conservative, "traditionalist" element represented by the army, church, monarchists and great landholders. Throughout 1940 the Falange remained politically dominant, with its national council (membership 100) constituting the legislative body and its 19-man political junta serving practically as the government cabinet. At the beginning of 1940 the Falange was presumably working in complete accord with the army, which had been granted affiliated membership in the F.E.T. Their uncertain relationship was indicated, however, by the dismissal, in March, of General Muñoz Grande from the secretary-generalship of the Falange and his ex officio cabinet post, and by analogous cabinet changes later in the year. In August the F.E.T. militia was reorganized to enable collaboration with the army in the compulsory military service program and, in December, the Falange took full charge of the political and premilitary training of Spanish youth.

The Franco administration rewarded the church with an annual grant of 62,900,000 pesetas, provided for its participation in education, fostered the rebuilding of churches, returned confiscated Jesuit properties and annulled civil marriage and divorce. Concessions, however, were more apparent than real and the government interposed its iron hand in clerical as well as in secular affairs. Church interference in politics was discountenanced and papal pretensions to the appointment of Spanish bishops rigidly opposed. Monarchists, weakened by divided loyalties, enjoyed considerable prestige but not the extensive privileges anticipated. As a conciliatory gesture to great landowners, lands expropriated under the agrarian laws of 1932 and 1935 were restored to their former proprietors; areas needed for irrigation and drainage projects were expressly exempted, however, and provision was made to prevent the immediate displacement of actual holders of the land.

The most urgent social problem was the shortage of food. Bread and other essential foods were being rationed late in the year, and, despite government anti-profiteering measures, prices ranged from 50% to 200% greater than in 1936.* Immediate relief needs were met by the *Auxilio Social*, Falange women's organization, whose activities tended to relax traditional Spanish restrictions upon women. In an effort to increase cultivation, the government provided in Jan. 1940 for an unlimited number of drainage and irrigation projects in which land would be worked by either private or government sponsored societies. A ten-year program of material reconstruction was likewise announced in January, envisaging the expenditure of 4,200,000,000 pesetas—1,650,000,000 pesetas each for hydraulic projects and highway-railroad repairs, and the remainder for harbour improvements.

Nationalist Spain's politico-economic structure is patterned after that of Portugal and Italy, with rigid government control of industry along lines conducive to national self-sufficiency. In accordance with the Syndical Unity law of January, vertical industrial syndicates embracing both executives and workers were

SPAIN'S FASCIST GOVERNMENT decided in 1940 to leave the Toledo Alcázar in ruins as a monument to the Nationalists' successful resistance to a 71-day siege at the beginning of the civil war in 1936

gradually affiliated with one major syndical organization under the F.E.T. Strikes and lock-outs were prohibited and labour assured a minimum wage and an eight-hour day. A noteworthy feature of economic reorganization was the shifting of light industries from Catalonia and the Basque country to agricultural central Spain; this was in conformity with the government's campaign against Catalanian and Basque autonomist tendencies.

Developments in Spain's pro-axis foreign policy were shaped by both domestic exigencies and the kaleidoscopic international scene. Early in the year neutrality was maintained with respect to the European war, but axis military successes soon encouraged a more vigorous stand. On June 12, two days after Italian entrance into the war, Spain declared its "non-belligerency," and on June 14 Spanish troops occupied the International Zone of Tangier (although formal control was not announced until Nov. 4). Meanwhile agitation began for further North African expansion and the occupation of Gibraltar. On Oct. 18 dramatic emphasis was given the pro-axis trend when Ramón Serrano Súñer, General Franco's strongly fascist brother-in-law, was appointed foreign minister, succeeding General Juan Beigbeder Atienza, who, in common with many army generals and other "traditionalists," was reported to favour a less aggressive international policy; the new foreign minister continued as head of the political junta but surrendered his important interior ministry to the caudillo himself. Spanish-axis accord was further signalized by Serrano Súñer's visits to Berlin and Rome in September and November, General Franco's meeting with Adolf Hitler at the Spanish frontier in October and the visit to Spain in the same month of Heinrich Himmler, nazi gestapo chief. Spanish belligerency was momentarily expected but failed to materialize. In the latter part of the year expressions of anti-British feeling became somewhat less violent as negotiations were opened with Great Britain and the United States in an effort to procure vital foodstuffs and other commodities. Meanwhile, Spain vigorously championed the "spiritual unity of the Hispanic world," an ideal linked with its generally hostile attitude toward the United States. Diplomatic relations with Chile, which had been severed in July because of that country's pro-Republican sympathies, were restored on "The Day of the Race" (Oct. 12).

Banking and Finance.—The peseta was valued at 9.13 cents; gold reserves were almost negligible, and the currency was artificially controlled. A deficit of more than 8,000,000,000 pesetas accrued during the Spanish Civil War, to which another 2,600,000,000 deficit was added by Jan. 1940, bringing the national debt to almost 25,000,000,000. Ordinary budget appropriations for 1940 totalled 5,960,245,000 pesetas (almost 25% higher than the pre-Civil-War budget), and the extraordinary budget (an innovation), 1,200,977,000; 1,500,000,000 went for defence and only 882,000,000 for agriculture, education and public works combined. Government receipts were about 3,000,000,000 pesetas for the first half of 1940. In December, the entire internal tax structure was revised, bringing an extension of the sales tax and increased levies on luxuries, landed estates, unearned income and inheritances.

Trade and Communications.—Internal communications suffered severely during the Civil War. Post-Civil-War valuations (in millions of pesetas) of railroads were 3,965, motor vehicles 288 and merchant marine 210, nearly a 40% average decline. River and air transport facilities were negligible even before the Civil War. Determining factors in Spain's sharply decreased foreign trade were the exchange shortage, leading to a bilateral compensation policy, and the European war, which restricted markets, supply sources and shipping facilities. Statistics published in mid-1940 covering April-Dec. 1939 showed imports valued at \$111,978,000 (\$286,940,000 in 1935) and exports at \$78,287,000 (\$190,613,000 in 1935). Foodstuffs comprised 42% of imports (14% in

1935), with wheat alone accounting for more than 25%, and cotton, normally the top-ranking item, declining to only 3.5%; Argentina contributed 27.9% (2.5% in 1935), the United States 14%, Germany 12.9%, the United Kingdom 5.1% (10.4% in 1935) and France 1.7% (5.5% in 1935). Exports changed little in composition, with foodstuffs and raw materials (chiefly oranges and other fruits, nuts, olives and olive oil, cork and its manufactures, iron ore and pyrites, mercury and naval stores) accounting for about 85%. Principal markets (with percentages of exports taken) were the United Kingdom (25.4), Germany (24.8, as compared with 12.7 in 1935), the United States (10.1) and Italy (6.2). In 1940 the extension of the war and the British blockade further restricted external commerce, but the collapse of France re-opened continental trade channels which hostilities had earlier closed. Argentina remained the principal exporter to Spain.

Agriculture and Industry.—The chief industry is agriculture, although less than half the arable land is under cultivation; main products are grains, olives, grapes and citrus and other fruits. Minerals are abundant, including iron ore, copper, manganese, lead, mercury and potash salts. In 1939 and 1940 industrial recovery was retarded by serious shortages of raw materials (cotton, fertilizers, fuels, hides), machinery and other capital equipment and skilled labour. Agricultural production in 1940 generally gained over 1939, with notable increases in the case of rice (nearly normal, and 92% more than in 1939) and olives (expected to provide an exportable surplus of 100,000 metric tons); wheat output, about 80% of normal, was greatly inadequate for domestic needs.

Textile production in 1939 was only 35% of normal, steel 60%, cement 50%, tanning and shoes 40%, paper 65% and fertilizers and heavy chemicals 50%.

BIBLIOGRAPHY.—Charles E. Chapman, *A History of Spain* (1918); E. Allison Peers, *Spain, the Church, and the Orders* (London, 1939); A. Randle Elliott, *Spain After Civil War* (*Foreign Policy Reports*, May 15, 1940); *Bulletin of Spanish Studies* (quarterly). (C. E. CH.; R. H. SH.)

Spanish-American Literature. Outstanding in Argentina's literary contribution of 1940 were some interesting books considering the composite elements that constitute that nation, attempting to define a doctrine of national existence and trying to foresee the nation's future development: *Meditación en la costa* by Eduardo Mallea, *Meditación argentina* by Carlos Alberto Erro, *La muerte del indio. Elogio de la raza nueva* by Félix Esteban Cichero.

Venezuela gave one of the most significant books of the year: 1941. *Cinco discursos sobre pasado y presente de la Nación venezolana* by Mariano Picón Salas. In view of the 1941 presidential election, Picón Salas called on the youth of Venezuela to bring forth a national reorganization after the many years of brutal dictatorship suffered by the country, threw the light of his keen intellect on all national problems and formulated a plan for democratic reconstruction.

Important also were *¿Qué haremos con la historia?* by the Colombian writer Germán Arciniegas and the lucid Ecuadorian books *El sentido histórico y la cultura* by Dr. Julio E. Moreno and *Años de oprobio* by Dr. Gualberto Arcos.

Looking to their historical background, the Spanish-Americans proceeded during 1940 in their work of re-creation of their history. Bolívar, as usual, was the subject of several books among which may be cited *El superhombre. Vida y obra del Libertador* by J. A. Cova and *Viaje stendhaliano. Tres ensayos sobre la psicología amorosa del Libertador* by Luis Correa. The centennial of General Santander was the occasion for the publication of numerous works about him, the most interesting being *Santander* by Fernando González and *El hombre de las leyes* by Max Grillo.

Of both historical and literary value was a *Martí, hombre* by Gonzalo de Quesada y Miranda, the son of the Cuban hero's secretary. An excellent work was the systematic and complete book by F. Romero, A. Vasallo and L. Aznar on the Argentinean philosopher *Alejandro Korn*.

In the field of literary research and criticism 1940 was a fruitful year. Gerardo Seguel's *Alonso de Ercilla* studied the poet as the founder of Chilean poetry and thought. Important was the second edition, published in 1940, revised and enlarged, of Carlos González Peña's *Historia de la literatura mejicana*. Important also was the augmented second edition of Luis Alberto Sánchez's *América. Novela sin novelistas*. In opposition of views to the latter was *Novelistas hispanoamericanos* by Professor Arturo Torres Ríosco. Prof. Torres, who in 1939 published *La novela en la América hispana*, dealing with the history of the novel and the different novelistic schools in Spanish-America, studied in his latest book, with his usual insight and independent criticism, the personality and the works of the most distinguished Spanish-American novelists. Hernán Díaz Arrieta published an interesting monograph on *Don Alberto Blest Gana*. Marcelo Olivari's *Lugones* is a critical biography of the late Argentinean poet.

Essays on letters, arts, philosophy, were in 1940 to be found in *Textos y pretextos* by Xavier Villaurrutia; *Imagen del teatro. El teatro por dentro*, on the Mexican theatre, by Antonio Magaña Esquivel; *Panorama del nuevo teatro* by José Ma Monner Sans; *Fanatismo y misticismo*, with a good study on surrealism, by Adolfo Menéndez Samará; *Mitos, mujeres y encajes* by Antonio Reyes; *Mensajeros del ideal* by Néstor Bermúdez; *Villa de la Unión* by Alfonso Reyes; *La flecha en el arco* by Emilio Rodríguez Mendoza; *Significación de las cosas* by Carlos René Correa; *Diecisiete divagaciones* by Misael Chavarri; *Jesús* by Ricardo Davila Silva.

Worthy of the reputation of Pedro Henríquez Ureña, the Dominican

third volume of his *Poesía*. Other books of poetry published in 1940 included *Cantos de la tierra prometida* by Juan Cotto, the Salvadorian poet recently deceased; the pastie *Tierra marinera* by Fernando Luján; *Mástiles al sol* by Gregorio Castañeda; *Cuatro poemas* by the distinguished Cuban poet Eugenio Florit; *Ya viene la primavera* by Rafael R. Vidal; *Sonido*, of an excellent lyric quality, by the rising Venezuelan poetess Isola Gómez. Jorge Carrera Andrade, perhaps the best living Ecuadorian poet, published *Microgramas*, synthetic poems of Japanese formula and *Pais secreto* of a profound melancholy. Antonio Massis, a Chilean poet of Arabian parentage, published a very original book of verses *Litoral celeste*. Luis Merino Reyes' *Latitud* is a blend of classic and modern feeling. The Argentinean Fernández Moreno wrote in *Continuación* a book of poetry in minor tone and excellent quality. Silvina Ocampo in *Viaje olvidado* shows promise. Good poetry is also to be found in *El alma lejana* by Edmundo Bianchi and *Mares ultrajados* by Ernesto Pinto of Uruguay.

Of the group of social-minded Spanish-American poets the following productions were important: *La sangre y sus estatuas* by the Chilean Andrés Sabella, *Poemas de una sola angustia* by the Dominican Hector Inchaustegui Cabral and *Trinchera* by the Cuban G. González Contreras. Arturo Torres Ríosco wrote a *Canto a España viva* in which the poetical and philosophical values rise together to a high mark.

An interesting item was the book *Poesía indígena*, a translation of Nahuatl poems by Angel Ma Garibay.

The outstanding theatrical productions of the year were the historical drama *Rueda de Fuego* by Roberto Levillier and two comedies by Samuel Eichelbaum, *Un guapo del 900* and *Pájaro de barro*. (L. Mo.)

Spanish Colonial Empire. Total area (approx.) 322,300 sq.mi.; total population (est. Dec. 31, 1937) 26,055,000.

The table below lists the colonies, protectorates, etc., of Spain, together with certain essential statistics appropriate to each of them, including the mother country itself.

Spanish Colonial Empire

Country and Area sq.mi. (approx.)	Population Estimated Dec. 31, 1937 (000's omitted)	Capital, Status, etc.	Principal Products (in metric tons)	Imports and Exports (in thousand pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in thousand pesetas)

scholar, was his 1940 book *Plenitud de España*, studies in the history of culture.

In the field of fiction, Mexico's Mariano Azuela published *Avanzada*, a good novel, in vivid and rugged style. Other Mexican novels of the year were *Paludismo* by Bernardino Mena Brito, and *Caos* by A. Izquierdo Albiñana. The group of Ecuadorian novels, so distinctive in Spanish-American literature, was augmented in 1940 by *Trabajadores* by Humberto Salvador, *Pinceladas de la tierra* by Alejandro Andrade Coello, and *Sumag Allpa* by G. Humberto Mata. The Peruvian writer, Rosa Arciniega, published *Playa de vidas* in subjectivist mood. In Chile, *Cien mil palabras* by Jacobo Nazaré was a good novel of social significance. A curious work was the Bolivian novel *Puna* by Hugo Blym. The outstanding Argentinean novel of 1940 was Adolfo Bioy Casares' *La invención de Morel*, fantastic and anti-psychological.

On the short story shelf might be found the interesting *Cuentos negros de Cuba* by Lydia Cabrera; *Paseo de mentiras* by Juan de la Cabada, good in landscape and in psychology; *Sombra* by Arturo Martínez Galindo; *Multitud*, well written short stories by Humberto Jaramillo Angel; *Dos novelas cortas* by Joaquín González Eiris; *Pichamón* by Leoncio Guerrero, stories of the Maule region in Chile, of the "criollista" school; *Consejas del Gran Río* by Edmundo de la Parra, strange tales of the Bio-Bío; *Kupen. Cuentos de la Tierra de Fuego* by Enrique Campos Menéndez. An *Antología del cuento hispanoamericano* was published by Antonio R. Monzor.

Poetry blossomed in 1940. Enrique González Martínez published the

Spelman Fund of New York was chartered in 1928. The fund, during 1940, continued its program directed at the improvement of the methods and techniques in the field of public administration. During the year, the fund appropriated \$431,000.

The chairman of the board of trustees is Charles E. Merriam; the executive and secretary, Guy Moffett. (G. Mt.)

Spens Report: see EDUCATION, VOCATIONAL: Great Britain.

Spices. Between Oct. 1939 and the belligerency of Italy and the fall of France, the spice business went along

about as usual. Subsequent developments resulted in cessation of trading in Hungarian seeds and paprika, Balkan herbs and discontinuance of Turkish imports. France was an important source of supply and its large herb and celery seed business came to an abrupt halt. The French colonies saw their trade decrease sharply. The Mediterranean basin with its valuable spices was in 1940 tightly sealed, except for the few items native to the Iberian peninsula. Because a heavy tonnage of paprika had early been rushed to the U.S., practically the only market for it, there was little change in the price of paprika, but replenishment was uncertain. When 1940 opened, speculative stocks of black pepper in the U.S. approximated 51,700 tons—the requirements for about 3½ years. Imports fell off because of heavy 1939 shipments.

Wars usually cause high prices, but Netherlands Indian mace, nutmegs and cloves declined. The explanation is that countries blockaded in the war formerly bought these goods. There were heavier offerings to the U.S. Ginger crops in Sierra Leone and Jamaica were good and supplies were obtainable at less than customary figures. The largest producers of cloves are Zanzibar and Madagascar. In both places the business was government controlled. Higher priced cloves were expected. England and Europe formerly supplied most of the U.S. needs for mustard seed. England in 1940 put its acres into cereals; Europe had no access to America. Consequently, the farmers of California, Oregon, Washington and Montana planted more mustard seed than usual, but conditions in 1940 proved unfavourable. In some sections only 20% of a normal yield was harvested. Montana gathered about 55% of normal tonnage. The crops brought good prices. Interest in the crop increased. Acreage for 1941 may be the largest on record. The temporary passing of Holland was the more regretted because it produces very fine caraway and poppy seeds. These soon may disappear from the U.S. market.

For some years red peppers have engaged the attention of southern U.S. farmers. Disaster destroyed the 1940 harvests in Louisiana and Mississippi. Some growers delivered only 10% on tonnage contracts, with the result that there was an increased use of Oriental red peppers. Crops of fiery African red peppers were good, but expensive transportation made them costly.

Saigon cinnamon may become scarce because French Indo-China, its habitat, is a war area. Such Chinese cinnamons as canton rolls, mat cassia, taiwo, cassia buds and kwangsi were in uncertain supply through Hongkong. China, however, maintained the flow of cinnamons from the mainland to Hongkong, thence to the world.

Excepting for spices originating in lands affected by war, price changes were few. The use of spices in the U.S.A. grows as the public becomes better informed. Research disclosed that red peppers are a bountiful source of vitamin C. As 1940 closed, markets were stronger on news of British ships being transferred from the U.S.-East Indian-African routes to North Atlantic service. Scarcity of cargo space impended. (C. A. T.)

Sports and Games: see AIR RACES; ANGLING; ARCHERY; AUTOMOBILE RACING; BADMINTON; BASEBALL; BASKETBALL; BILLIARDS; BOWLING; BOXING; CHESS; CRICKET; CURLING; CYCLING; FENCING; FOOTBALL; GLIDING; GOLF; HANDBALL; HORSE RACING; ICE HOCKEY; ICE SKATING; LACROSSE; MOTOR-BOAT RACING; POLO; ROWING; SHOWS; SOCCER; SOFTBALL; SQUASH RACQUETS; SWIMMING; TABLE TENNIS; TENNIS; TRACK AND FIELD SPORTS; TRAP-SHOOTING; WRESTLING; YACHTING.

Squash Racquets. The veteran player Donald Strachan, of Philadelphia, Pa., did not contest his

national title in 1940 and his place was occupied by another skillful Philadelphian, A. Willing Patterson.

The contest for the national doubles championship was a particularly keen one, with the winning team of Hunter H. Lott and William S. Slack, of Philadelphia, retaining their title for the third consecutive year. Another repeater was registered in the play for the national amateur team title, which went to Boston, Mass. Among collegians, the best in this field was Kim Canavaro, of Harvard, winner of the national collegiate title. The University club's fifth annual invitation intercollegiate squash racquets tournament was won by Charles Brinton, Princeton senior.

The 1940 crown in the competition for the national professional title was won by Alfred Ramsey, of Cleveland, O., who at 38 years of age beat his opponent who was 12 years younger (Eddie Schaeffer, of Pittsburgh, Pa.) in 20 minutes of play. Lester Cummings, the 1939 titleholder, did not compete because of the death of his father, but he won the metropolitan professional crown for the second time in a row. This victory gave Cummings a second leg on the George E. Ruppert Challenge trophy, three of which are necessary to retire it from competition. Miss Cecile Bowes won the women's national singles title, taking the place of Miss Anne Page who wore the crown for three years. A strong duo came to the fore in winning the women's national doubles for the second year, Mrs. John E. Bierwirth and Mrs. William H. Adams. Mrs. Ary J. Lamme won the women's metropolitan title. (J. B. P.)

Squires, Sir Richard Anderson (1880–1940), ex-prime minister of Newfoundland, was born at Harbour Grace, Jan. 18. He was educated at the Methodist college and Dalhousie university. He was called to the bar in 1911 while a member of the Newfoundland legislature. He was minister of justice and attorney-general, 1914–17, and colonial secretary 1917–18, and became leader of the Liberal party in 1919. He was prime minister, 1919–23, and again, 1928–32. He died in St. John's, March 26.

Stalin, Joseph Vissarionovich (1879–), Russian statesman and general secretary of the communist party of the U.S.S.R., was born in Georgia and succeeded Lenin as virtual dictator of the soviet union in 1924 (see *Encyclopædia Britannica*, vol. 21, p. 301).

Stalin, as usual, made few public appearances or statements during 1940. His mouthpiece for foreign affairs was Molotov (*q.v.*); for internal affairs, his various other commissars and the press. Successful conclusion of the Finnish war and annexation of the three small Baltic states and Bessarabia and northern Bukovina were the notable fruits of his foreign policy during the year. Stalin held a personal interview with Sir Stafford Cripps, the British ambassador, on July 1, but the results of British attempts to woo Russia away from the axis were not immediately apparent. (See also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: see PHILATELY.

Standards, National Bureau of. One of the most difficult problems confronting the National Bureau of Standards is to anticipate and, if possible, to keep a little ahead of the requirements of industry for new and more precise standards. An important step in this direction was taken during 1940. The new high voltage and X-ray laboratory building was completed and turned over to the bureau by the contractor in April. The equipment installed will permit measurements at the highest potentials used in elec-

trical and X-ray work. The larger part of the building is a single room, 136 ft. long, 65 ft. wide and 60 ft. high, so constructed as to form a complete metallic enclosure, or Faraday cage, which gives definite electrical conditions and prevents a high voltage discharge from interfering with other electrical measurements at the bureau. The X-ray equipment includes a 1,400,000-volt direct current generator capable of delivering an X-ray excitation current of 25 milliamperes. This is the most powerful generator thus far built and will supply two X-ray tubes, one of which is for standardization of dosage meters and the second for exploratory work in co-operative studies with the National Cancer institute.

The bureau's low-temperature laboratory has been rebuilt to give needed laboratory floor space, and the capacity of the liquid-air plant has been doubled.

The standard frequency radio broadcasting service was modernized and improved. Announcements are made by voice only and are given every five instead of every ten minutes. The duration of these announcements and of the intervals between them are so accurate that they themselves can be used as interval signals. The maximum deviation of any one of the oscillators from the mean value of the seven which constitute the national standard is only three parts in 100,000,000.

Many studies have been made of methods for extinguishing fires. A series of tests was conducted with carbon dioxide for fighting fires in buildings. The gas displaces the air required for combustion and thus smothers the flames with no water damage. It should prove a valuable adjunct to fire-fighting methods, particularly in buildings in which valuable records are stored. In co-operation with the Civil Aeronautics authority, tests are in progress to determine the best method of extinguishing fires in the engine compartments of aeroplanes in flight. Special testing equipment, including an engine nacelle built in front of the bureau's large wind tunnel which is used to blow an air stream over the engine, was provided for this work. Carbon dioxide and carbon tetrachloride systems have been tried with success.

A practicable method for the commercial production of ribose, a rare sugar of potential biological importance, has been developed at the bureau. Considerable attention has been devoted to the new synthetic materials, and a circular on synthetic rubber was published in July. This meets an urgent need, and the first edition of the circular was quickly exhausted. As a part of the work on synthetics, studies have been made of the permeability of these materials to hydrogen and they have been found to possess advantages over natural rubber for balloons and airships. It also appears probable that such materials as nylon and vinyon may be used advantageously to replace natural textile fibres under some conditions. A co-operative project supported by the textile foundation is concerned with scientific and economic research for the benefit and development of the textile industry. This program is well under way and several fundamental papers have been published in the bureau's *Journal of Research*.

The co-operative research project, supported by the American Silver Producers, on new industrial uses for silver was brought to a successful conclusion. Interested industries have been given the results of this work and are proceeding with the development of commercial processes for lining containers, silver plating of electric contacts and the production of new industrial alloys containing silver.

The testing of materials and types of construction suitable for low-cost houses was continued, and 60 reports in the building materials and structures series have been issued. Special interest has been shown in the reports on typical wood frame construction, floor coverings, insulation and roofing materials. A third survey of roofs in service, covering the north central states, was conducted during the latter half of the year.

A report issued by the National Advisory Committee for Aeronautics deals with the bureau's work on light metal structural alloys in thin-sheet form. It is the most comprehensive report available on the subject and is particularly important in the designing of modern aeroplanes, railroad cars, etc., where strength depends upon a thin skin covering a large area.

In the field of commercial standardization the bureau has continued its endeavours to reduce waste through the elimination of needless varieties of sizes and styles of commodities. In particular, the simplification of containers for food products has received attention. New commercial standards are being developed through the co-operation of manufacturers, distributors and consumers; important ones published during the year cover domestic oil burners and after-market lights and signalling equipment for automobiles.

The bureau has continued its co-operation with purchasing agents of states, counties and cities in promoting the buying of supplies on the basis of specifications. It is also working with the American Standards association in the development of safety codes, a special accomplishment in 1940 being the issuance of several parts of the revised edition of the National Electrical Safety code.

The part played by the bureau during the war of 1914-18 is well known. Its work on optical glass, aeroplane engines, instruments and materials, and in the testing of supplies bought by the government, is a matter of history. In connection with the preparedness program, the bureau was again called upon for advice on military problems, including the properties of materials, the quality of supplies and the performance of instruments and equipment.

In the light of developments during the latter part of 1940, it was fortunate that an important step toward increased efficiency in procurement had been taken late in 1939. This was the creation of an Interdepartmental Screw Thread committee to take over and continue the work formerly carried on by the National Screw Thread commission. This committee was organized by the departments of war, navy, and commerce and has already issued a comprehensive report giving the standard screw threads and tolerances for government work.

The annual conference of State Utilities Commission of Engineers and the 30th National Conference on Weights and Measures, which were held at the bureau, were unusually successful. The attendance at the former conference was the highest on record and the latter was well above the average. Subjects of special interest discussed by the weights and measures group included the metering of bottled gases, the sale of packaged commodities and the best methods for instructing inspectors and for interesting the public in weights and measures matters. Members of the bureau's staff took a leading part in the symposium of thermometry organized by the American Institute of Physics and in the American Scientific congress held in Washington in May 1940.

The staff of the bureau on June 30, 1940 numbered 982 employees and 82 research associates. The regular appropriation for the fiscal year 1940 was \$2,266,000, which included \$100,000 for the purchase of additional land to round out the bureau's site and \$198,000 for the special investigation of building materials and structures suitable for low-cost housing. In addition, deficiency items totalling \$79,000 were provided. The results of the year's work were made available through 276 printed publications and articles. Forty-four mimeographed letter circulars were prepared and distributed on specific request. (L. J. Br.)

Stanford University (Leland Stanford Junior university).

In the year 1940 construction neared completion on the new \$600,000 building to house the Hoover Library on War, Revolution and Peace, so that its formal dedication in June 1941 will be one of Stanford's major semicentennial events. The David L. Farnsworth fund for general medical research work was established through a bequest of \$900,000 by Mrs. Lotta P. Rossier.

The president of the university appointed a Stanford National Emergency committee to take inventory of the university's personnel and research facilities. For the students a civilian pilot training course was inaugurated under the Civil Aeronautics authority and given jointly by the university, which handles the ground school work, and by the Palo Alto airport, which offers flight instruction in radio-equipped training planes.

Work on the Klystron was continued, particularly in the application of the Klystron's ultra-short radio waves for possible military use; and its special use for the blind landing of aircraft was carried forward by the Sperry Gyroscope company, the university's licensee. Notable too in the research field was the construction in the physics laboratory of a cyclotron to conduct investigations of the technological qualities of steel.

Beginning with the autumn quarter the tuition fee for all students was raised \$15 per quarter. In spite of this and the initiation of the national defence program, there was no decrease in the total registration of students. The faculty in 1940 numbered 595; the students, 4,349, of whom 1,355 were women and 1,140 were graduates. (R. L. W.)

Stark, Harold Raynsford (1880-), U.S. naval officer,

was born at Wilkes-Barre, Pa., on Nov. 12. Graduated from the U.S. Naval academy in 1903, he was commissioned ensign two years later and served on various ships and at various naval stations from 1903 to 1917. During the World War of 1914-18 he was on the staff of Admiral William S. Sims, commander of the U.S. naval forces in European waters. He was chief of the naval bureau of ordnance from 1934 to 1937. On March 15, 1939 he was appointed chief of naval operations with the rank of admiral.

Admiral Stark was persistent throughout 1939 and 1940 in his pleas for a larger U.S. fleet and appeared a number of times before the congressional naval committees to urge larger appropriations. Upon his recommendation the house committee reported out the \$4,000,000,000 bill for a two-ocean navy June 18, and scarcely more than a month later the bill was signed by President Roosevelt. On Sept. 3 Stark certified that the 50 destroyers

traded to Britain for naval and air bases in the western hemisphere were not essential to U.S. national defence.

Steel: see IRON AND STEEL.

Stettinius, Edward R., Jr. (1900—), U.S. industrialist, born Oct. 22 at Chicago, Ill., and educated at the University of Virginia, where he was a student from 1919 to 1924. The son of a wealthy father, he went to work in 1924 as a common labourer with General Motors corporation. Within six years he was assistant to the president and in 1931 vice-president.

In 1936 the U.S. Steel corporation made him chairman of its finance committee, an important office theretofore reserved ordinarily for men with long years of experience as business executives. In April 1938 he was named chairman of the board of "big steel." Meanwhile he had served as liaison officer between the NRA and the Industrial Advisory board. In the fall of 1939 he was named director of the short-lived War Resources board, an agency appointed to formulate industrial mobilization in case of war. On May 28, 1940 President Roosevelt made him commissioner of industrial materials for the Council of National Defence—a full-time job.

In the "super-defence" Office of Production Management, created Jan. 7, 1941, Stettinius became director of the important priorities division.

Stewart, George Craig (1879-1940), U.S. Protestant Episcopal bishop of Chicago, was born in Saginaw, Mich., August 18. He graduated from Northwestern university in 1902 and from the Western Theological Seminary, Chicago, in 1903. He was ordained as a Methodist, but in 1903 became an Episcopalian.

In Feb. 1930 he was elected coadjutor bishop of Chicago and was named bishop in November of that year. Bishop Stewart was noted as one of the leading preachers in the United States. He died in Chicago, May 2.

Stimson, Henry Lewis (1867—), U.S. statesman, of whom a biographical sketch appears in *Encyclopædia Britannica*, vol. 21, p. 410. A republican, he became an ardent admirer of Cordell Hull's policies as secretary of state (the office Stimson had held in Pres. Hoover's cabinet) and was always quick to defend Hull's actions against criticism. He favoured in particular a strong stand for the United States against Japan, Germany and Italy. Pres. Roosevelt appointed him secretary of war on June 20, 1940, the day Harry H. Woodring resigned the office. Confirmed by the senate, 56 to 28 on July 9, Stimson made several inspection tours of U.S. defences and consistently advocated speed-ups in the race against time for preparedness. On Dec. 13 he attributed the delay in production of war materials to strikes in vital industries and to private competition with the government for supplies and machinery. A week later he was appointed one of the four members of Pres. Roosevelt's "super-defence council." The others were Secretary of the Navy Knox, Sidney Hillman and William S. Knudsen, chairman.

Stimson on Oct. 29 drew the first number in the U.S. draft lottery—158.

Stock Exchanges. The New York Stock Exchange during 1940 made a considerable number of important changes in its rules. The most significant of these

actions may be grouped under five main headings:

Actions Designed for the Greater Protection of the Public.—Effective Feb. 1, the New York Stock Exchange announced a revision of its audit requirements whereby each member firm doing a business with the public shall select an independent public accountant to conduct an annual audit at a date selected by the accountant. According to the ruling, "the first indication a member firm is to receive that an audit is to be made of its affairs will be the appearance of the accountants at the office of the member firm." It was also announced, on Aug. 13, that "the minimum desirable scope of the blanket bond insurance of member firms doing business with the public should include coverage, running to the firm itself, against loss of its own or customers' property regardless of legal liability, of loss through employees' dishonesty, through theft or disappearance whether or not negligence played a part, through fraudulent trading by employees, through forgery or through loss in transfer." A new type of bond developed by insurance underwriters was also submitted to members, which provides that "the insurance company would restore promptly to the firm, up to the limit specified in the bond, any money, securities or other property of the firm, or its customers, of which the firm may be deprived by any fraudulent or dishonest act of any of the firm's partners."

Changes in Listing Requirements.—On May 4 announcement was made by the committee on stock list that new preferred stocks would not be listed unless the stock provided at least the following minimum voting rights, namely, (1) the right of the stock, "voting as a class, to elect not less than two directors after default of the equivalent of six quarterly dividends," and (2) "the affirmative approval of at least two-thirds of the preferred stock, voting as a class, as a prerequisite to any charter or by-law amendment altering materially any existing provision of such preferred stock."

Changes with Respect to Current Business Practices.—Effective March 1, the board of governors of the New York Stock Exchange adopted the recommendations of the special committee on brokers' and exchange revenues, with respect to mandatory service charges for custodian services, collection of coupons, dividend claims, transfers, transcript statements and special services. Subsequently this action was amended so as to permit application

TRADING IN STOCKS on the New York Stock Exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

of the custodian charge of \$1 either monthly or quarterly, and to permit a waiver of the charge altogether if a purchase or sale had taken place in an account during the monthly or quarterly period. On March 27, however, the action was repealed, it being announced that 400 of the 518 firms favoured such repeal.

Various actions were taken by the New York Stock Exchange with respect to multiple exchange trading. On Feb. 14 a special committee reported in favour of the rigid enforcement of the exchange's constitutional provision prohibiting members of the exchange from dealing on another exchange in securities which are listed on the New York Stock Exchange, and this recommendation was approved by the board of governors on Feb. 28. Later, on April 12, Governor Lehman signed the Williamson bill, removing prohibition of a stock exchange from making rules preventing a member from trading with members of other exchanges, thus facilitating the New York Stock Exchange's enforcement of a rule against multiple trading privileges. On April 12 the board of governors ruled that, effective Sept. 1, "members and member firms may not act as dealers, odd-lot dealers or specialists on other exchanges in securities which are listed on the New York Stock Exchange, but may continue to accept orders from customers for execution on such other exchanges." It was reported that 25 firms were affected by the ruling. Subsequently, on Oct. 25, the Securities and Exchange commission requested the New York Exchange to rescind its ruling. Thereupon the exchange advised that it "would await the full SEC report of its investigation, in order to ascertain if any new facts had been developed, before reaching a final decision on the commission's request."

On March 13 the board of governors of the New York Exchange amended the rules defining a "registered representative" so as to include under that designation "individuals engaged in the solicitation of subscriptions to investment advisory or to investment management services furnished on a fee basis by their member firm employers."

Mention should also be made of the rulings of the SEC restricting the use of customers' securities as collateral, such rules to become effective Feb. 17, 1941. According to press accounts: "Brokers and dealers are prohibited from commingling the securities of different customers as collateral for loans without the customers' consent; from commingling customers' securities with their own securities under the same pledge; from pledging customers' securities for more than the amount the customers owe them." The new rules were designed to give customers added protection against loss in the event of brokerage failures.

Proposed Legislative Changes.—The Coudert-Mitchell bill, introduced in the New York legislature on Jan. 25, provided for (1) repeal of the double taxation on odd-lots, (2) repeal of the emergency tax provision in effect since 1932, and (3) the establishment of new rates of one cent for each share sold for less than \$10, two cents on shares sold between \$10 and \$50, and three cents on shares sold for \$50 or over. Hearings were held on this bill, and the president of the New York Exchange also advocated, before the New York State Budget hearing, a reduction in the stock transfer tax on the ground that "not only is our securities business being diverted to other states, but the state of New York is being deprived of revenue which it otherwise should receive were the transfer tax modified realistically." Following its passage, the Coudert-Mitchell bill, it should be stated, was vetoed by Governor Lehman.

Reports of Committees Making Recommendations with Respect to Special Studies.—Two such reports deserve special mention, namely:

(1) Report of the special committee of the New York Stock Exchange for the separation of brokerage from dealing and

underwriting business. Firms dealing with the public and also doing business as an underwriter and dealer, it was recommended, should be permitted to incorporate separately their underwriting, dealing and trading business, the brokerage business to be transacted by the firm as a partnership. The recommendation was approved by the board of governors on March 27, and on April 3 the committee on member firms announced its readiness to receive applications from member firms desiring to form affiliated companies.

(2) Newspapers carried accounts of a plan "for the consolidation of the 'night branch' with the 'day branch' of the Stock Clearing corporation, and a complete overhauling of the corporation's operations." The consolidation, to be effective Feb. 1, 1941, was reported to be designed to bring about both substantial economy as well as clearing efficiency.

Stocks and Bonds.—The importance of the New York Stock Exchange as a major national market is shown by the huge volume of listings of securities. For stocks on Dec. 1, 1940, such listings aggregated 1,234 separate issues, totalling 1,457,085,000 shares, with a market value of \$41,848,247,000. Listed bonds, on the same date, represented 1,307 issues, with a par value of \$54,237,357,000 and a market value of \$50,755,887,000. The number of issuing corporations or governmental units totalled 864 for stock issues and 613 for bonds. Roughly speaking, the New York Stock Exchange serves as the market place for approximately one-fourth of the total wealth of the United States. Of the aforementioned totals, foreign stock listings on December 1 aggregated only 40,484,000 shares, with a market value of \$635,217,000, while private and public bonds of foreign nations stood at \$4,360,474,000 par value, with a market value of \$1,988,291,000.

Sales of stock on the New York Stock Exchange for 1940 totalled 207,605,359 shares, and for bonds, \$1,671,598,875. For stocks the ratio of stock sales to listings amounted to 1.44% for the last month for which data were available. For bonds the ratio of sales to listings for the same month amounted to 2.93%. Volume of stock sales, it will be noticed, was, as in 1939, at a rather dull level during 1940, the stock total being 207,605,359 shares as compared with 262,015,799 shares for 1939, 297,000,000 for 1938, and 409,000,000 for 1937, and bond sales \$1,671,598,875 as compared with \$2,048,237,875 for 1939, \$1,859,525,825 for 1938, and \$2,790,323,300 for 1937.

Net borrowings of New York Stock Exchange members on collateral amounted to only 0.87% of the market value of listed shares on Dec. 1, 1940, whereas at the same date for 1939, 1938, 1937, 1930, 1929 and 1928, the ratios were, respectively, 1.26%, 1.35%, 1.69%, 4.06%, 6.32% and 9.66%.

With respect to the New York Curb Exchange, sales during 1940, as reported by the *New York Times*, totalled 43,041,774 shares as compared with 45,800,633 shares during 1939, 49,795,922 shares during 1938, 104,178,804 shares during 1937, and 134,843,049 shares during 1936. Bond sales totalled \$304,605,000 during 1940 as compared with \$446,059,000 during 1939, \$367,937,000 during 1938, \$442,993,000 for 1937 and \$823,050,000 for 1936.

(S. S. H.)

Stocks. Despite the sensational war news of the year, from both a national and international point of view, 1940 stock market movements were in no sense extraordinary. In fact, the market as a whole was surprisingly steady in view of the year's news. For nearly all groups of stocks the price level remained substantially the same from January to April 1940, and at a figure about the same as the monthly average for Dec. 1939. After April a moderate decline occurred, which spent its force by the close of June. Thereafter a rise ensued, month by month, to December, although the price level reached was considerably

below the Dec. 1939 level for all groups of stocks, with the exception of the railroad group. From the beginning of Dec. 1940 the price level remained substantially the same, with, however, a drooping tendency, particularly in the so-called war stocks.

Using the Standard Statistics company barometer figures (average for each month based on daily closing prices), the average monthly price of 20 representative railroad stocks stood at 31.2 for Jan. 1940, as compared with 31.7 for Dec. 1939. Thereafter a rather serious decline occurred which reached its culmination in June with a monthly average of 22.1, or a decline of approximately 29%. Thereafter a steady increase in the price level took place, month by month, until for November a monthly average of 31.1 was established. This average, it should be noted, was almost the same as that for Dec. 1939, namely, 31.7.

In the field of industrial stocks, using the Standard Statistics company average for 50 leading issues, the average monthly price stood at 119.0 for Jan. 1940, as compared with 120.2 for Dec. 1939. Thereafter the average declined to 93.0 for June 1940. After that month the average showed a consistent monthly increase until November (the last month available) when the average stood at 110.7. This November average, it should be noted, was considerably below the Dec. 1939 average of 120.2. Similar price movements occurred in other leading groups of stocks, like the public utility, and copper and brass groups. The public utility group showed a monthly average decline from 70.4 in January to 56.8 for June, and a subsequent rise to 58.9 for November. The copper and brass group declined between January and July from 134.8 to 92.3, with a subsequent rise to 114.6 for November. The November averages for

these two groups, however (namely, 58.9 and 114.6), were still materially lower than the corresponding averages for Dec. 1939 of 68.5 and 141.3. Combining all of the afore-mentioned groups of stocks (90 shares), the market showed a decline from 97.7 in January to 76.8 in June and a subsequent rise to a monthly average of 90.2 for November. This November average of 90.2 can be compared with the Dec. 1939 average of 98.2.

At the close of Jan. 1940 the market value of all listed shares on the New York Stock Exchange stood at \$45,636,656,000. At the close of June, the bottom of the year's decline, this market value stood at \$38,775,241,000, a depreciation of 16%. On Dec. 1 the combined value had again risen to \$41,848,247,000, whereas the year previous (Dec. 1, 1939) the figures were \$45,505,229,000.

From the foregoing data it is clear that 1940 stock market movements were in no sense sensational, as might so well have been expected in a period of world conflagration. The decline during the first half of the year, with respect to each of the leading groups of stocks, was in substantial measure counterbalanced by the rise from July to November, latest figures, however, indicating that the price level was still considerably behind that established at the close of 1939. The whole showing is rather surprising in view of the substantial enlargement of business activity due to large war orders, and the initiation of a national defence program. Probably the absence of substantial market movements is attributable to the fact that fundamental conditions affecting business have not changed materially. The burden of taxation upon corporations, an unbalanced national budget and a burdensome and growing indebtedness seemed to indicate in 1940 every prospect for further extensions. Increased volume of business was counterbalanced with fears in the direction of possible price restrictions and general governmental regimentation of business. As previously explained, the stock market is a discounter of the future. The queer action of the market during the year probably represented a discounting of the future action of the government with respect to the afore-mentioned factors.

Evidently, stock-market-wise, war no longer affords the speculative community the glamour that was the case at the close of 1914 and the first half of 1915. In 1939 the most sensational increases were confined to industrials likely to profit from war orders. Thus Bethlehem Steel and United States Steel common at one time rose to \$100 and \$82, respectively, but closed the year with declines to \$82 and \$66. In 1940, although operations were at full capacity, the shares of these two major companies never reached a higher price level than \$93 and \$76.50, and on Dec. 22 the quotations were \$85 and \$68½.

Number, Volume and Amount of Stocks.—According to the New York Stock Exchange's compilation, the total of stocks listed on that exchange on Dec. 1, 1940, stood at 1,457,085,000 shares, with a market value of \$41,848,247,000. This value compared with \$45,505,229,000 and \$46,081,000,000 at the corresponding dates of 1939 and 1938. Of 1940's total, United States stocks

The above figures are an average for the month based on daily closing prices, except for copper and brass, which are weekly prices. (Source of data—Standard Trade and Securities, Statistical Bulletin—Standard & Poor's Corporation.)

aggregated 1,416,601,000 shares, valued at \$41,213,030,000, and foreign stocks 40,484,000 shares, valued at \$635,217,000. The total of shares was distributed over 1,215 separate U.S. issues and 19 foreign issues, representing a total of 864 issuing corporations.

Total shares traded on the New York Stock Exchange during 1940 amounted to 207,605,359, as compared with 262,015,799 shares in 1939; 297,446,059 shares in 1938; 409,468,000 in 1937; and 1,124,991,000 in 1929, the largest total on record. From the standpoint of activity in sales, the 1940 market may be described as relatively stagnant and rarely did daily sales exceed the 2,000,000 share mark. The New York Curb Market had sales during 1940 of 43,041,774 shares. For other security exchanges of the country data were not available at the time of this compilation, but the other U.S. exchanges are relatively unimportant, as regards volume of transactions, in comparison with the New York Stock and the New York Curb Exchanges. (See also STOCK EXCHANGES: *Stocks and Bonds*.) (S. S. H.)

Stone. The form in which it is produced leads to two main classifications for stone: dimension stone and crushed or broken stone. Dimension stone is used in building construction, monuments and memorials, curbing, flagstones and paving stones. Crushed and broken stone are used mainly in concrete aggregate, road metal, railroad ballast and riprap, besides a number of other uses dependent on the specific character of the various kinds of stone, especially with limestone and sandstone. In general, only a little over 1% of the total output is dimension stone, although it represents probably one-sixth of the value.

The main varieties used include basalt, granite, limestone, marble and sandstone; among the minor varieties are mica schist, argillite, volcanic rocks, boulders and serpentine. Discussion of granite and marble will be found in the article MARBLE AND GRANITE.

Basalt.—Trap rock, or basalt, production in the United States in 1939 was only 101,300 short tons as dimension stone, but 15,990,000 tons as crushed stone. 86% of which was used as road metal or concrete aggregate, and 5% as railroad ballast. British production of basalt is not reported separately, but is included with other igneous rocks under MARBLE AND GRANITE.

Limestone.—The production of limestone as dimension stone in the United States in 1939 increased 50%, to 1,061,000 short tons, valued at \$6,678,000, while crushed and broken stone increased by 23% to 90,785,000 tons, valued at \$88,140,000. Of the dimension stone, 98% was for building stone, while 61% of the crushed stone was for concrete aggregate and road metal, 17% for metallurgical flux, 4% for railroad ballast and 5% for agriculture. These figures do not include some 30,000,000 tons used in cement and 8,500,000 tons used in lime, which would give a grand total of about 130,000,000 tons. Canadian limestone production decreased in 1939 by 25% to 4,150,000 short tons, valued at \$3,818,000.

The production of limestone in Great Britain in 1938 decreased slightly to 18,830,000 long tons, valued at 4s. per ton; of this total, 40% was for road metal and ballast, 32% for lime and cement, 12% for metallurgical flux, 5% for the chemical industries and 4% for concrete aggregate.

Sandstone.—The production of sandstone as a dimension stone is comparatively small in the United States, the 1939 output being 195,600 short tons, valued at \$1,956,200, an increase of 18% over 1938; 41% of this was used in paving, curbing and flagging, and the remainder as building stone.

Sales of crushed and broken sandstone were 8,658,000 short tons, valued at \$9,789,000, a rise of 41% over 1937; of the total, 65% was used for concrete aggregate or road metal, 7% as a re-

fractory, 3% as railroad ballast and 4% as riprap. The production of sandstone in Canada increased 74% in 1939, to 176,300 short tons, valued at \$311,800.

Sandstone production in Great Britain in 1938 increased by 1% to 4,947,000 long tons, valued at 7s. 10d. per ton; of the total, 56% was used as road metal or ballast, 15% as a refractory, 14% for concrete and 11% as building stone. (G. A. Ro.)

Stones, Sharpening: see EMERY.

Straits Settlements is one of the three larger subdivisions of British Malaya, the others being the Federated and Unfederated Malay States (*qq.v.*). It is administered by a governor with an advisory council (governor, Sir Thomas Shenton Whitelegge Thomas). The area is 1,356 sq.mi.; the population, according to an estimate of 1939, was 1,372,362, divided, according to race, as follows: Chinese, 877,348; Malays, 306,382; Indians, 149,284; Europeans, 14,189; Eurasians, 12,953; others, 12,206. The Straits Settlements includes the two chief ports of Malaya: Singapore and Penang. Its administrative subdivisions are: Singapore island, Penang island, Province Wellesley, Malacca, Pangkor, Christmas island, Labuan and the Cocos islands. The 1940 revenue was £4,375,482; the expenditure was £5,273,367. The public debt amounts to 30,000,000 Straits dollars. There are 1,007 mi. of metalled roads and 3,612 mi. of telegraph and telephone lines. There are wireless stations in Singapore and in Province Wellesley, serving Penang.

The principal exports in 1938 were rubber, tin, motor spirit, copra and rice. The unit of currency is the Straits dollar (47.51 cents U.S. in Dec. 1940). (W. H. CH.)

Strategic Mineral Supplies. While the armed conflict of 1940 was confined to rather restricted areas in Europe, Asia and Africa, the entire colonial empires of Britain, France, Belgium, the Netherlands, Italy and Japan were almost as much involved as were the mother countries. Furthermore, among the nominally neutral countries, few were in reality neutral, for nearly all were so closely linked with one or more of the belligerents, either geographically, economically or politically, that their neutrality was a very lopsided affair. With the whole world engaged in conflict, active, prospective or potential, the subject of strategic mineral supplies received primary consideration by all concerned, especially since so many important producing areas were embraced by the zones of conflict.

It is now pretty well recognized that the only safe solution of the problem is the creation and maintenance of emergency stocks of these materials sufficient in amount to cover any prospective shortage if and when outside sources of supply are no longer accessible. France started on a program of stocking manganese ore as early as 1923 and there was evidence of similar moves in other countries later, especially Germany and Italy, and it is understood that Great Britain also did considerable stocking when she finally woke up to the fact that war was inevitable. The full extent to which the stocking program was carried, the countries involved and the materials stocked, could not (Jan. 1, 1941) be determined and might never become known, but it was certain that stocking was done to a sufficient extent to alter in a very material degree the abilities of the various countries participating in the war to meet their emergency demands. In fact, it is quite likely that without stocking in advance, the war would have been brought to an entirely different status and might even have been ended. For example, it would hardly need much in the way of argument to convince even the most casual observer that Germany would not have been able

to maintain her air force and mechanized units on the scale that was evident if she had available only current supplies of petroleum and the domestic output of motor fuel from by-product sources, without an extensive accumulation of stocks in advance. In fact, the main questions asked in 1940 were whether these stocks were exhausted and, if not, how much longer they would be likely to last. The same was true of other materials.

In the United States the accumulation of emergency stocks has been advocated since about 1925, but it was not until June 1939 that such a program was officially recognized and authorized. Even then, the enabling act to supply the necessary funds was limited to such a small amount and so much time was lost in fixing specifications that the outbreak of war in Europe came before much progress had been made, resulting in still further delay and disorganization of the program because of the disturbed condition of the market.

At the end of the fiscal year, June 30, 1940, the results of the first year of operation were reported, but were relatively so small as to be of little significance. Later in the year, the original program was supplemented by purchases made by the Metals Reserve company, an agency of the Reconstruction Finance corporation, and by the end of the calendar year considerable progress had been made, although no statement was forthcoming of the total orders placed or the amounts of the various commodities actually delivered.

Aside from the purely domestic features that were an integral part of the United States defence program, the most interesting feature of the strategic minerals situation was the extent to which the progress of the war altered the status of Germany through the acquisition of needed sources of mineral supplies in the countries conquered and occupied.

In the past, Germany's greatest deficiency had been in iron ore; two-thirds of the supply was imported and, since the imported ores were of better grade than those of domestic origin, the actual equivalent was probably nearer three-quarters. The areas under military occupation in 1940 reduced this shortage to a sufficient degree that the remaining amounts could be secured from Sweden, where the economic domination was almost as strong as was the military domination in the occupied areas.

With copper, lead and zinc, extensive smelting capacity was acquired in the occupied countries, but there was little mine output, the smelters having been operated with imported ores. This being the case, little relief was gained except for such stocks of metals and ores as the plants happened to have on hand at the time of capture. The only exception to this was the zinc ore output of Poland, where ore production was about 60% of smelting capacity. Aside from these minor ore supplies, Germany lacked access to outside sources of ore to maintain operation of the plants.

The bauxite deposits and aluminium smelting plants of France lie outside the occupied area, but if these materials were seriously needed in Germany, doubtless pressure would be put on the Vichy government to make them available, regardless of any domestic requirements. Between this and the economic tributaries of Hungary and Yugoslavia, both ore supply and smelting capacity could be maintained.

By a successful application of the principles of blitzkrieg, Germany succeeded in wiping out some of the most serious of her original handicap in the way of metal supplies, but others remained. Of these, probably manganese and nickel were the worst. The Norwegian nickel supplies could not more than partly fill the German needs, and aside from advance stocks, the only available source of manganese was, in 1940, the Soviet Union, with deposits far removed from the German border and transportation facilities limited. On the other side of the struggle, Great Britain was handicapped by the loss of smelting sources in France, Bel-

gium and the Netherlands, but still had access to adequate ore supplies if it could supply the necessary bottoms and get them through the German blockade. Nevertheless, in spite of these and other losses, the shift from offensive to defensive warfare probably strengthened the British position more in a relative degree than conquest strengthened the German position.

(G. A. Ro.)

Strategy of the European War. Perhaps the greatest strategical lesson of the European war up to Jan. 1, 1941 was the necessity for closer relationship between strategy and policy; a necessity arising from the far greater dependence than ever before of fighting forces upon industrial support on the one hand, and upon the increased speed of movement of fighting forces on the other, which deprived unprepared nations of the power of recovering from the initial blows of an enemy and thus compelled the makers of policy to take greater account of military considerations. The historic "muddle" period which distinguished not only British but other nations' approach to war was sharply reduced; there was in 1940 no time for muddling.

Thus was emphasized the need for better instrumentalities for creating and effectuating a sound military policy, and for relating it to the other departments of state policy; especially in democratic states, since such instruments existed already in totalitarian states and were indeed inherent in the nature thereof. Von der Goltz's maxim that each state must have a national strategy could not be more strongly underlined than by the events of the European war; but to have such a strategy it is not enough that soldiers and sailors and airmen should make plans within their specialized fields, or that plans for utilizing the industrial resources of the nation should be laid out on paper. There must be a complete correlation of policy with strategy; of the political ends to be sought with the military means available to achieve them. Such correlation must be flexible; adaptable to changing conditions and changing needs. Obviously, therefore, the machinery for achieving it must be a permanent part of

MOMENTOUS MEETING of Hitler and Mussolini at Brennero, Italy, on March 18, 1940, preceding the Nazi invasions of Norway, the Low Countries and France

the governmental structure; and since the responsibility for the making of such plans cannot be divorced from the responsibility for their execution, it is clear that such machinery must include, in its directing body, the highest executive officials of the state as well as its chief military and naval authorities. It is only thus that the resources available may be used to the best advantage, and that the foreign relations of the state may have that support which is essential to their successful conduct in a world where, unhappily, force remains the fundamental element in international relations.

If not so supported by a continuous and authoritative policy-making body, strategy is hampered and perhaps fatally weakened at the moment when it comes into play. If the uses to be made of the armed forces have not been thought through, they will be deficient in equipment, organization and training for the employments which war may require of them. Thus the national strategy of France hinged upon the Maginot line as a protection against German invasion; yet the Maginot line was not extended along the Belgian frontier, thus resting the security of France upon Belgian ability to resist a German onset, while relations with Belgium were permitted to deteriorate to a point where such resistance could not be depended upon. Obviously either there should have been the closest and most thorough Franco-Belgian military co-ordination; or a French defence system which took no account of Belgium as a potential ally; or, if this were too expensive, then the whole Maginot conception was wrong and the money expended on forts should have been put into improving and increasing the field army, which is not fixed in position and could meet an enemy thrust wherever it came.

Strategy of "Blitzkrieg."—The so-called German *Blitzkrieg* represents nothing new in strategical conception. Its chief reliance is on speed, which has been called "the hand-maiden of surprise"; and speed and surprise produce in turn those physical and psychological dislocations which have ever been the chief aims of master strategists. The best strategy is of little effect unless there exists the tactical means for exploiting its dispositions; a feature of German *Blitzkrieg* strategy is its boldness, which in turn means its complete confidence in its tactical means to carry out any mission assigned to it. These tactics are still based on the historic tactical twins, fire and movement, with the intervention of the aeroplane as a member of the battle-team, providing as it does the increased mobility on the battlefield of which the machine gun had for a little time tended to deprive the ground forces, and supplemented by the use of armoured troops on a scale hitherto unheard of.

In general, German tactics seek to follow the principles of von Schlieffen and von Moltke—envelop, surround, destroy. To "horizontal envelopment" by outflanking movements has been added "vertical envelopment" by air forces (hitherto this was only possible to a limited extent by artillery fire); and attacks from the rear have been made both more feasible and more dislocative in their effects by the speed and fire-power of mechanized troops. In the Polish campaign the essential aim of the German strategy was to envelop the Polish armies in a double pincer movement; the northern pincers closed on the corridor, the southern on Silesia; the two then combined in a grand pincer movement directed upon the main Polish forces and on Warsaw. The supply and reinforcement of the Polish armies and the completion of their mobilization became impossible from the first, due to the "vertical envelopment" strategy of the German air force. In the Norwegian campaign the envelopment of the Norwegian army and people was accomplished by the immediate seizure of the main seaports, which were also the main mobilization centres of that country. In the campaign against France and the Low Countries, the Dutch were enveloped by the use of

parachutists and fifth columnists in Rotterdam and at key positions elsewhere in the country; the Allied armies of the northwest were enveloped by the armoured forces, supported by motorized forces, which broke through on the Meuse and raced down the Somme to the Channel coast, while the German air force effectually hampered the manoeuvring power of the main French forces. In all these campaigns, speed and boldness were the characteristic elements of German strategy, which nevertheless was securely founded on the ancient precepts of concentration, offensive action and security.

Strategy of Air Power.—As most sober students of war had predicted, air power found its chief and most useful application in this war, its first great testing ground, when used in conjunction with surface forces for the achievement of well considered ends. It proved quite incapable, by itself, of gaining a major decision. It did not overwhelm Britain in a few days, nor did it even begin to weaken the morale of the British people. The use of air power by the Germans as a part of their military force in Poland and France was a notable example of planning and staff work, implemented by brilliance in execution.

Its effect was greatest where numbers of planes and pilots, short ranges and accumulations of material permitted a high degree of continuity of action, as in the short campaign against France. Both in France and Poland this effect was accentuated by the weakness of the defender's air forces. When the *luftwaffe* clashed with the qualitatively superior royal air force over Great Britain in August and September, it was defeated. Indeed, the effect of such qualitative superiority was shown to be a factor of much greater proportional importance than numerical superiority. Against effective opposition, the German air force was never able to obtain a sufficient degree of continuity of action, of steady application of force to a crucial point, to produce a decisive effect. This is inherent in the nature of the aeroplane itself, and of the uncertain and trackless element in which it operates.

One point little understood, but fundamental to air strategy, is the strategical immobility of air forces, illustrated again and again in this war, but notably in Norway and the Mediterranean. Lack of bases at first hampered German air operations in Norway, then acquisition of bases as against the British inability to do likewise permitted the Germans to gain the upper hand. In the Mediterranean the German air force was by Jan. 1, 1941 unable to intervene with any effect to save Italy from the blows of the British combined forces because it had no bases from which to operate either in Africa or the Aegean, and could not establish such bases by itself. Tactically the most mobile of all forms of armed power, within its radius of action from an established base, air power is strategically the most immobile because it cannot move its own base; this must be done for it by ships or on wheels. The larger and more complex the air instruments and weapons become, the more dependent air power is upon fully equipped and completely protected bases; the fate of the German dive-bomber squadrons in Sicily is suggestive of what may happen even to good squadrons when they have to depend on an ill-protected or improperly equipped base.

Naval Strategy.—The naval events of this war have served only to confirm the accepted underlying doctrine of naval strategy—that the object of all naval operations is the control of maritime communications, the preserving of them for one's own use, the denying of them to an enemy.

Unable to oppose the British at sea with surface forces, Germany has been compelled, in this war as in the last, to rely on the weapons of the *guerre de course*, the weapons of evasion, for her attacks on Britain's most vulnerable point: her sea-communications. Inability to maintain the sea-communications of

her overseas forces resulted in the collapse of Italy's African empire, where her isolated forces could not oppose the better supplied forces of Britain. Very probably the ability of Britain to continue to hold her grip on the Mediterranean, while keeping open the supply routes of the island of Great Britain herself, may prove the crucial test of this war.

Combined Strategy.—It is in the field, however, of the combination of strategical means—land, sea and air—that the military lessons of this war have been most significant. The German land-air combinations in Poland and France brought them victory; their land-sea-air effort in Norway was likewise successful, being countered by no comparable organization; but in the Mediterranean the British showed their ability to learn this lesson, and it seemed probable by Jan. 1, 1941 that their combined operations in the eastern Mediterranean would go down in military history as a classic example of their sort. The tendency is not toward a unified command of all forces: the French had this and failed; the British did not have it and were successful. It is rather in the field of combined planning, of close co-operation between the various types of forces, in adaptation to changing conditions and of mutual confidence born of association that the strategist of the future will find his greatest problems and reap his richest rewards. Air forces have become indispensable parts of land power as of sea power; there is also some, but so far a limited scope for independent air operations; even those taking place over Germany and Britain in 1940 were but parts and extensions of blockade and counterblockade, their object being to interrupt communications and interfere with the processes of armament, which was likewise the object of the blockading forces. In the better combination of military means for the achievement of military ends, and in the closer co-ordination of strategy with policy for the achievement of national ends, lies the task of the soldier and the statesman of tomorrow's war. (See also AIR FORCES; ARMIES OF THE WORLD; EUROPEAN WAR; LIGHTNING WAR; MUNITIONS OF WAR; NAVIES OF THE WORLD; TACTICS IN THE EUROPEAN WAR.) (G. F. E.)

Streamline Trains: see RAILROADS.

Strikes and Lock-outs. The United States, Canada and Great Britain publish current statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. Most of the other nations report them less regularly; some not at all. The Canadian department of labour published a report on strikes throughout the world in the *Labour Gazette*, March 1937.

The political situation in Germany, Italy, Russia and Japan has made it "inadvisable" in recent years for wage earners to undertake strikes. The European war added Czechoslovakia, Poland, France, Norway, Denmark and the Low Countries, to the area in which strikes would be ruthlessly suppressed.

The year 1940 saw less strike activity in the United States than in 1939, but a definite increase in the number of strikes toward the end of the year. In the first ten months of 1939 there were 2,032 strikes started,

Table I.—Number of Strikes, Workers Involved, and Man-Days Lost, 1933–October 1940*

*Strikes involving fewer than 6 workers or lasting less than 1 day are not included in this table nor in the following tables. Notices or leads regarding strikes are obtained by the Bureau from more than 650 daily papers, labour papers, and trade journals, as well as from all government labour boards. Letters are written to representatives of parties in the disputes asking for detailed and authentic information. Since answers to some of these letters have not yet been received, the figures given for the late months are not final. This is particularly true with regard to figures for the last 4 months, and these should be considered as preliminary estimates.

MOST PUBLICIZED STRIKE of 1940 was that of United Automobile Workers in the plant of Vultee Aircraft Inc. at Downey, Calif., where work on military aircraft was stopped. The strike was settled Nov. 26 after 12 days

in 1940 but 1,872; in 1939 there was a loss of 14,516,127 man-days, in 1940 only 6,894,976. During the first ten months of 1937, the loss of man-days was 26,768,955. During April 1939, 4,876,744 man-days were lost and in May 1939, 3,515,751. The maximum loss of man-days in any of the first ten months of 1940 was 865,000 in October. The drop in man-days lost from 1939 to 1940 resulted from the fact that there were no really big strikes in 1940.

Table I on page 639 shows for the United States the number of strikes, workers involved and days lost, 1933-40. The year 1937 is still the record year in number of strikes since 1917. The number of strikes began to increase in 1933 and rose steadily through 1937. Since then, it declined steadily through 1940. Severity of strikes also decreased.

The monthly reports on strikes issued by the United States

1939	122	41,038	224,588

Canadian Labour Gazette, March 1940.

bureau of labour statistics indicated that close to one-half of the strikes of 1939 involved some question of union recognition, with wages the other major issue. This distribution was characteristic of 1937 through 1940. Tables IV and V show the causes of British disputes and their results. Two contrasts with the United States situation stand out—in Table IV the absence of "union recognition" unless included in "questions involving trade union principles," and in Table V the large percentage of the strikes which ended definitely in favour of the employers.

Canada had only 153 strikes in the first 10 months of 1940, involving 60,166 workers. (See also UNITED STATES: *Labour Problems*.) (D. D. L.)

Submarine Warfare. In considering this summary¹ it must be understood that figures given herein cannot be officially verified. Reports emanating from one adversary are countered by denials from the opposite camp and the statistician finds himself in a maze of conflicting statements. There is good reason to believe, based both on experience during the war of 1914-18 and on neutral estimates, that British acknowledgments of naval and shipping losses are to be given considerably more weight than corresponding reports from axis sources. The fog of war thickens as the struggle becomes intensified and it is improbable that it will be dispelled until the dawn of another peace.

At the beginning of the war in 1939 there was little reason to suspect that submarine warfare would assume the important role it played in the critical year of 1917. Germany had but 65 submarines and most of these were small, short-range craft. German shipyards had not the capacity for mass production of submarines that it had in 1914, although this was capable of considerable expansion. It was believed that these U-boats had too short a radius of operation from their North sea bases to be truly effective against Atlantic shipping lanes. At the beginning of 1940 the general feeling was that Great Britain, through its vastly superior surface fleet, had effective control of the sea and that its blockade of Germany would provide the decisive factor in a somnolent war. Both Allies and neutrals were unable to foresee that the quickened tempo of submarine warfare would, by year's end, become the greatest menace with which the British empire had to contend.

The War on Shipping.—To arrive at the monthly merchant tonnage losses given in the table on p. 641 recourse has been had to two neutral and two British sources, all of which are considered reliable to the extent of information available to them at the time and all of which agree within reasonable limits. In cases of disagreement the higher figure has been taken as probably the most accurate and hence the grand total of losses for the year is slightly higher than given in other estimates. German claims have not been considered, as they are unquestionably exaggerated, the reason for this lying partially in the fact that the nazis are dependent upon submarine commanders for information. After

¹All assertions or opinions contained in this article are the private ones of the writer and are not to be construed as official or reflecting the views of the U.S. Navy department or of the naval service at large.

launching torpedoes a submarine normally dives deep to escape counterattack and is unable to observe actual results, sometimes mistaking the explosion of depth charges for that of its torpedo against the victim's hull. As U-boat commanders vie with each other for the prestige of "most tonnage sunk" it is but natural that their reports are coloured by wishful thinking.

The figures in the table are, in round numbers, the totals of merchant tonnage lost by the Allies and neutral tonnage usable by them. A total tonnage loss during 1939 of 901,344 tons including 130,000 tons lost by Germany was reported. Later information raised this figure and it appears that approximately 781,000 tons exclusive of German losses were sunk during 1939.

Allied and Usable Neutral Tonnage Losses

1939 Total Losses.		781,000
1940	Monthly Average	Grand Total
January	231,000	1,012,000
February	242,000	1,254,000
March	150,500	1,404,500
April	56,000	1,460,500
May	244,000	1,704,500
June	465,000*	2,169,500
July	317,500	2,487,000
August	380,500	2,867,500
September	405,000	3,272,500
October	421,000	3,693,500†
November	297,000	3,990,500
December†	339,000	4,329,500
Total for year 1940		3,548,500

*Includes heavy losses during evacuation of British troops from France.

†Later information will probably increase this figure.

‡For comparative purposes: Up to November 1 the British Admiralty admitted total allied and neutral losses of 3,547,000 tons and Hanson W. Baldwin, naval expert of the *New York Times*, estimated 3,400,000 tons, both since the beginning of the war.

That the British admiralty recognized the submarine threat is evident from action taken early in Jan. 1940 to establish a vast new minefield of about 200,000 mines and nearly 500 mi. in length in the North sea. Another clue to British concern was their action in requisitioning, effective Feb. 1, all merchant tonnage of the United Kingdom and colonies, affecting nearly 17,000,000 tons. In February, however, Winston Churchill, first lord of the admiralty, declared that the convoy system was effective and that the odds were 500 to 1 against the sinking of a convoyed ship.

During the early months of 1940 mines and aircraft proved to be almost as effective against shipping as were submarines; aircraft were particularly dangerous to small ships in coastwise traffic. With the effective application of degaussing gear and the increase in minesweeping squadrons the menace from mines, magnetic and otherwise, steadily decreased.

Losses due to submarines fell off sharply during March and April and the Allies optimistically attributed this to their own superiority at sea. It is recognized that this phenomenon was due to the concentration of U-boats in home waters prior to and during the Norwegian sideshow. To offset the loss of prestige suffered in Scandinavia as well as the loss of potential submarine bases in the Norwegian fjords the British profited by gaining direct control of about 4,000,000 tons of Norway's shipping, although a large portion of this was already sailing under British charter.

During May and June, events of gravest import to the success of the counterblockade occurred on the continent. The invasion of the Low Countries yielded submarine building facilities of incalculable value to the nazis and probably also added a few Dutch submarines to their flotillas. With the downfall of France Germany obtained not only more building yards and perhaps a number of French submarines but also, of infinitely greater value, excellent advanced submarine bases at Cherbourg, Brest, Lorient, Bordeaux. The occupation of these made it possible for their short-range submarines to be used successfully in harrying the Atlantic trade routes and the effects were soon felt.

June brought the highest merchant tonnage losses of the war, 465,000, but a considerable share of these was incurred in the evacuation of Dunkirk and other French ports. The entrance of Italy into the war in this month was a factor greatly strengthening the counterblockade, adding about 130 submarines to the axis flotillas. Fascist headquarters promptly announced that a number of these would be used in the warfare in the Atlantic.

As a result of nazi conquests most of the merchant fleets of both Holland and Belgium came under complete British control. The former had afloat about 3,000,000 tons, but Belgium boasted only about 400,000 tons of commercial bottoms. Some Danish and French shipping was also known to have come under the British flag. A neutral study made in July indicated that the merchant fleet available to Britain was then stronger than at war's outset.

In July Berlin announced a "quickened tempo" of submarine warfare and in August officially declared a "total blockade" of Great Britain. These pronouncements were given force by a steadily mounting toll of losses from July through October, when the startling monthly figure of 421,000 tons was reached. For September and October the nazi high command laid extravagant claim to a total of 1,308,600 tons (946,000 by submarines alone) in contrast to the probable total figure of 826,000 tons for the same period. But the latter figure was alarming enough and prompt counteraction was taken by the British. In early September the already historic "destroyers for bases" deal was consummated with the United States, augmenting the British destroyer force by 50 overage but still effective ships. Extensive mining of possible submarine bases, from Norway to the Bay of Biscay, was carried out by the royal air force and heavy bombing attacks on actual U-boat havens were conducted with increasing frequency throughout the autumn. As Britain had by this time obtained about all ships possible from other sources British agents were sent to the U.S. to purchase immediately all available bottoms and to contract for the building of new freighters. On the entry of Greece into the war in late October the 1,800,000 tons, mostly antiques, sailing under the Greek flag were placed at Britain's disposal and early in November a small acquisition was made through requisition of the 24 Estonian, Latvian and Lithuanian vessels then in British ports. In spite of heavy bombings British shipyards continued to turn out new ships at breakneck speed and it was reported that during the first nine months of 1940 they completed a total of 426,551 tons.

In October the new U-boat tactics (see below) were becoming destructively effective and at the same time it was reported that "some dozens" of Italian submarines had been shifted from central Atlantic to more fruitful north Atlantic shipping lanes. New depredations by surface raiders, stuka bombers and speedy torpedo boats added to the gravity of the situation and led Prime Minister Churchill to declare in the commons that the recrudescence of submarine warfare constituted the most serious threat to the empire which, if continued, "will touch the life of the state." This speech was closely followed by vicious air assaults on submarine building yards in Germany.

Tonnage losses fell off somewhat during November and December but this can be attributed to the season of gales in the north Atlantic. In late November the minister of shipping admitted that losses exceeded new construction and that it was necessary to look to the United States for replacements. These losses were reflected by a stricter food rationing in Britain in December although as yet no real hardships were felt. Late in the year the minister of shipping further indicated the stringency by suggesting that all axis-controlled shipping in United States ports be turned over to Britain, and at year's end rumour was rife that a deal for many more over-age destroyers was pending.

Throughout the year British submarines were active against

German lines of supply to Norway, France and the "invasion ports." They achieved a moderate success and claimed many ships sunk, but no figures were by Jan. 1, 1941 available as to total Nazi tonnage involved.

As an indication of the increasing effectiveness of submarine warfare it is noted that during the first four months of the war, Sept.-Dec. 1939, the average monthly loss was somewhat less than 200,000 tons; during the same period in 1940 it had mounted to nearly 400,000 tons. This was disturbing, but as yet fell far short of the figures for the first six months of unrestricted submarine warfare in 1917 when losses averaged over 600,000 tons a month. The capability of Britain, however, to cope with the situation was much less than during the war of 1914-18. After the French debacle it became necessary for the royal navy to assume entire responsibility for the Mediterranean, strengthening its forces there at the expense of other areas. At the same time the blockade was stretched to the limit to cover the entire European coastline and this called for further dispersion of forces. Heavy losses in destroyers, the arch-foes of submarines, added to the difficulties of the situation. As a result convoys travelled under too light an escort and there was an acute shortage of anti-submarine vessels. The neutrality of Eire was a further handicap as it denied use of excellent naval bases on the west coast of that island and required patrol and escort vessels to make much longer runs to English and Scottish ports; at the end of the year diplomatic and economic pressure were being placed on Eire to overcome this obstacle. With the expected heavy spring U-boat offensive a super-effort would be required to prevent losses from exceeding the grim figures of the war of 1914-18.

Submarines in Naval Actions.—The submarine in 1940 had shown no particular effectiveness against naval vessels in the war. It is probable that the Germans employed most of their U-boats against merchantship objectives except during the Norwegian campaign, but it is believed that British submarines were on continual prow for naval craft, without any notable successes. It is possible, however, that they proved valuable, as they did in 1914-18, against U-boats; news of such actions was strictly censored and the results could only be surmised. The lack of success of both British and axis submarines against capital ships was undoubtedly largely due to the superior speed and manoeuvrability and to the water tight compartmentation of such targets. No major naval craft had by Jan. 1, 1941 been definitely sunk by a submarine since the "Royal Oak" in Oct. 1939.

From such items as have been made public it is assumed that British submarines were largely used in close blockade of enemy naval bases and, after April, in a war against German lines of communication to Norwegian and French ports and against the Italy-Libya route. Close blockade duty, due to the invariable presence of minefields, was unusually hazardous and probably accounted for a large percentage of British losses.

In Jan. 1940 the British admiralty announced the loss of the submarines, "Seahorse," "Undine" and "Starfish," the first submarines lost by enemy action, while on a dangerous mission in Heligoland Bight. Two British destroyers were also lost in January, by enemy torpedo or mine. In February another destroyer was acknowledged lost by submarine action while on convoy duty.

During the Norwegian campaign submarines seem not to have been used to the limit of their capabilities. German submarines are known to have been recalled from their Atlantic patrol and, from such meagre data as is available, they were probably placed on guard off the occupied Norwegian fjords to waylay any counter-attacks. Their lack of success was phenomenal; the Nazis report only having sunk by submarine a former Polish destroyer

(later verified) and 3 British transports (not verified). British submarines were stationed in the Skagerrak and along the Norwegian coast to operate against enemy naval forces and lines of communication. These appear to have been more successful in their mission and were rumoured to have penetrated the heavily mined Cattegat into the Baltic. On April 8, the day before the invasion, a British submarine torpedoed and sank the German troopship "Rio de Janeiro" with great loss of life. On April 10 the admiralty claimed that an enemy cruiser (class unknown) was torpedoed and probably sunk by submarine action. Neutral Swedish reports stated that on April 11 at least 6 Nazi troopships were sunk in the Skagerrak; this was not verified. On April 15, Britain laid claim to 2 more troopships sunk by submarine in the Skagerrak and a few days later they acknowledged the loss of their submarine "Thistle" by enemy action. With heavy naval forces of both antagonists keeping the sea in a fairly restricted area the failure of submarines to strike more telling blows can probably be laid to faulty staff work.

During the invasion of the Low Countries and the fall of France submarines played a very minor role. British submarines were reportedly concentrated in the approaches to the channel to guard against invasion and to fend off interference with the evacuation from Dunkirk. Following the occupation of Dutch and Belgian ports it was rumoured that German submarines were being converted into transports for ferrying the army of invasion to England. This is considered improbable.

In early June the British acknowledged the loss of their auxiliary cruiser "Carinthia" (20,277 tons), a former luxury cruise ship, by submarine action; this was the first admitted loss of an auxiliary cruiser since the "Rawalpindi" disaster in 1939. Late that month the admiralty announced that a British submarine had attacked and damaged the German battleship "Scharnhorst" off Trondhjem fjord and, a few days later, that another Nazi troopship had been sunk by submarine south of Norway. Early in July the Germans claimed to have torpedoed the new British aircraft carrier "Illustrious" but gave no further details; though possibly damaged, this fine ship was in service at year's end. Shortly thereafter the British admitted the loss of another destroyer by submarine action.

The surrender of France in June was a serious blow to the British submarine flotillas as well as to all British armed forces. France entered the war with 78 submarines and probably completed several more since; her known losses were only 2. While no definite figures were released it seems probable that of those remaining only a small percentage joined the "Free French" forces in Britain.

It is definitely known only that the world's largest submarine "Surcouf" (2,880 tons) and "several others" arrived in British ports. Of the remainder it is probable that the majority were immobilized under terms of the Franco-German armistice, although there were indications that some former French submarines were in 1940 operating under German command. This loss, combined with the stupendous gain in axis submarine strength when Italy entered the conflict, completely turned the tables of comparative submarine strengths against the British.

On July 10 occurred an action between two submarines: the British "Parthian" torpedoed and sank an Italian submarine at close range, the loss being admitted by the fascist high command. A few days later an Italian submarine torpedoed and sank a British destroyer, both actions taking place in the Mediterranean. Early in August the Germans claimed the U-boat sinking of another British destroyer and a British submarine, no details being vouchsafed. On the same date the Italians claimed that the British submarine "Oswald" had been rammed and torpedoed in the Ionian sea; the admiralty later confirmed this loss. In mid-August the neutral Greek cruiser "Helle" (2,115 tons), while at anchor at Tinos island, was mysteriously sunk by an unidentified submarine. In view of strained relations between Greece and Italy popular opinion laid this crime on Italy's doorstep, although the fascist press loudly blamed Britain for "another 'Athenia' case."

In early September Swedish newspapers reported the sinking by a British submarine of a large German transport, escorted by destroyers, in the Skagerrak with a total loss of about 4,000 lives. This was later confirmed by the admiralty which credited the achievement to the "Sturgeon." About the same time Italy laid claim to sinking a British warship, type not stated, by a submarine in the straits of Gibraltar. There was no verification and this claim must be classed as extremely doubtful.

During the Dakar incident in late September it was reliably reported that attacks were made by 3 French submarines on the British and "Free French" forces present. One torpedo struck but failed to sink a British light cruiser, while 2 of the submarines were sunk—one being the "Persee." Two British destroyers were also sunk in this action but apparently this was by gunfire rather than by submarine action. In the later (November) attack by this same force on Gambon the British report that the French submarine "Poncelet" was scuttled during the action off the coast of Senegal.

In mid-October the admiralty reported that British submarines attacked a German convoy, sinking, in addition to several supply ships, 2 escort vessels of unstated type. On the same date the fascist high command announced a gun duel between the Italian submarine "Toti" and the British submarine "Perseus," resulting in the sinking of the latter. On Nov. 4 the

British admitted the loss of 2 large auxiliary cruisers, "Laurentic" (18,724 tons) and "Patroclus" (11,314 tons), both by submarine action. On Nov. 12 Italy claimed that a submarine, while attacking a convoy, inflicted damage on an unidentified British cruiser. Shortly thereafter the Italians further claimed to have torpedoed but not sunk a British destroyer; this was undoubtedly the Canadian destroyer "Saguenay" which, while on convoy duty in the north Atlantic, was struck by a torpedo but limped safely into port.

As the year closed the small force of 6 Greek submarines stepped into the limelight in emulation of the heroic deeds of their landsman brothers. Greek headquarters reported that on Dec. 28 their small submarine "Papanicolis" slipped through a destroyer screen to sink 3 Italian troopships on the Brindisi-Valona run, with great loss of life.

Submarine Losses.—Germany.—As no admissions of any U-boat sinkings were divulged by the nazis it is extremely difficult to arrive at a reasonably accurate estimate of their submarine losses. The only information is that emanating from British and French sources and this has been neither official nor complete. British claims as culled from the neutral press mentioned only 27 individual sinkings of German submarines throughout 1940, but other responsible statements raised this figure considerably. Late in January Winston Churchill announced that half of Germany's original U-boat fleet had been exterminated. A few days later Cesar Campinchi, French minister of marine, declared that a total of 40 German submarines were accounted for by Allied action. These two statements agreed very closely. Late in February Mr. Churchill further estimated that Germany had only 35 submarines left. As Germany was believed to have entered the war with about 70 U-boats this indicated, if correct, either a high rate of destruction during February or a failure to add to their original flotillas by new construction. In early March, M. Campinchi reported that the French navy alone had sunk 12 German submarines since the beginning of the war. No further estimates of German losses were released until near the end of 1940 when British naval sources laconically reported that anti-submarine warfare "is taking a very good toll." There is good reason to believe that the British reports were not unduly optimistic. (In 1918 the writer had occasion to sit with British naval boards to determine individual cases of submarine losses and found them ultra-conservative, demanding positive proof before giving credit for a sinking.) Assuming that the earlier British claims were fairly accurate, an average loss of about 6 U-boats a month is indicated, or a total of 36 during the first 6 months of the year. Thereafter, due to the fall of France and the entry of Italy into the arena, it seems reasonable to believe that the German toll dropped to about 4 a month. It is estimated, therefore, that approximately 60 U-boats were destroyed during the year and a total of about 84 sunk since Sept. 1939. This rate of sinking is not nearly high enough to offset probable new construction. (See below.)

Italy.—The fascist high command, up to Dec. 14, 1940, officially conceded the loss of 7 of their subsimmersibles. British reports of individual actions in which Italian submarines were lost reached a total of 10 and, just prior to her collapse, France claimed the destruction of "several" Italian submarines. In early December British sources claimed that 21 Italian submarines had been sent to the bottom. It is apparent that Italy suffered heavy losses and that her rate of replacement was not high.

Great Britain.—Up to and including Dec. 22 the admiralty acknowledged the loss of 22 submarines during the war. Press releases from Berlin noted but 9 individual claims of British submarines sunk by German action. On May 5, however, the nazis extravagantly claimed that 23 Allied submarines had been destroyed since the invasion of Norway, less than a month. No further summaries were released. Again it seems reasonable to place considerable credence in the British admissions for it must be remembered that England is still a democracy and that its people demand, and probably get, full knowledge of naval losses as soon as it can be safely released. An estimate of 25 British submarines lost during 1940 allows for a few which had not by Jan. 1941 been accounted for and is probably not far from the truth.

France.—Reports from the French, out of the war, can be presumed to be accurate. France acknowledged the loss of two submarines during the war and 4 since the war. Of the latter, 3 were accounted for by the actions off Dakar and Gambon; the fourth was possibly lost during the escape of light French forces from the British attack at Oran.

New Construction.—A vital factor in waging a successful war against shipping is the speed at which submarines can be built to augment the original flotillas and to replace lost vessels. At the end of the World War of 1914-18 Germany had achieved a maximum rate of 8.5 submarines a month, with production still increasing. As these were relatively large ships it is possible that, with the greater facilities available in 1940, the nazis were producing smaller U-boats at double this rate. In fact, as early as January they reported launchings at the rate of one a day. Just a month later, however, this claim was offset by Winston Churchill's statement to parliament that new German submarines were "not coming out as fast as expected." In late March Norwegian fishermen reported large numbers of submarines in the North sea and neutral naval observers estimated that many of these were constructed during the winter. There appears to be but little doubt that the German flotillas in the spring of 1940 were considerably larger than those with which she entered the war.

Nazi production facilities were almost doubled in May-June by the capture of extensive shipyards in Holland, Belgium and France, and by the securing of a greater flow of raw materials in northern France and the taking over of several diesel engine plants. According to British estimates at least 40 Dutch shipyards were absorbed and were operating with local labour. It is probable that a number of partially completed submarines were likewise secured.

October press dispatches from London indicated the British belief that the Germans were then completing one large submarine (probably about 1,500 tons) a day, plus mass production of so-called "minnows" (250-500 tons). If true, this rate of construction is astounding and might well prove the decisive factor in the war. The partial shift to a large submarine by Germany is probably due to a desire to operate well out on the trade routes, where the escort of convoys is lighter and the percentage of success higher. Neutral sources reported in November the appearance on the high seas of huge U-boats, capable of 19 knots, heavily armed and carrying 20 torpedoes. The rumour is not too disquieting; the description might well apply to the mod-

ern submarines possessed by all great naval powers (Germany excluded) before the war.

No information was available concerning the rate of British submarine construction. In view of the exigencies of the situation it seems probable that their naval building facilities were in 1940 largely concentrated on destroyers and other anti-submarine craft.

Submarine Tactics.—During the early part of 1940 U-boats seemed to be following the time-honoured method of attacking singly and without outside assistance. As was to be expected with short radius boats operating from inconvenient German bases, attacks took place relatively near the coast. With the conquest of Norway, however, they ranged farther to sea and attacked convoys before they had picked up their strong escorts. These tactics were further simplified when submarine bases at such advanced posts as Lorient, Brest and Bordeaux had been occupied.

In the autumn, when submarine warfare began to take its deadly toll, it appeared that a new system of attack had been adopted. Fragmentary reports piercing the screen of censorship indicated that attacks were made by groups of two or more large, fast U-boats which had been concentrated on their quarry by radio reports from long-distance nazi planes. They were also reported to be equipped with anti-aircraft listening devices for detecting the approach of convoys at night. German reports of U-boats dodging the gunfire of escorting vessels would indicate that at least some attacks were made on the surface, during twilight or by moonlight. Convoys, it was reported, were broken up and the fleeing merchantmen attacked singly. The admitted weakness of Britain in cruisers, destroyers and other escort vessels might permit such daring tactics. By these tactics the Germans claimed that on one night 26 ships were shot out of one convoy! As the British announced a loss of 42 ships during that week this boast may not have been as bombastic as other claims. The British admiralty reported that it possessed full details regarding these new tactics.

During the World War of 1914-18 the wakes of torpedoes were frequently sighted at some distance from the target ship, in time to permit manoeuvring to avoid being struck. Up to Jan. 1, 1941 such cases were conspicuous by their absence and led to the assumption that the nazis have at least partially perfected a wakeless torpedo which gives no warning of approach by its tell-tale trail of bubbles. (See also BLOCKADE; INTERNATIONAL LAW; NAVIES OF THE WORLD; SHIPPING, MERCHANT MARINE; STRATEGY OF THE EUROPEAN WAR.)

Sugar. No repetition of an acute world-wide sugar shortage, such as that of 1914-18, developed out of the European war, owing to a continuation of surplus production in 1940 in many countries and owing to various European governments having made forehanded preparation to increase sugar beet production. In Germany the 1940 sugar beet crop was reported as 20,000,000 metric tons¹, an ample supply, and comparable to the 1940 United States crop of 11,633,000 short tons of sugar beets which was the largest crop ever produced in that country. In the United Kingdom, although sugar was strictly rationed to minimize imports, the 1940 production was estimated at 520,000 metric tons of sugar. Following the War of 1914-18 the British government offered subsidies to encourage sugar production in the United Kingdom and built up such production from 50,000 tons in 1925 to 641,000 tons in 1934. Total production of sugar in Europe in the 1940-41 season is given by *Facts About Sugar*, November number, pages 19 and 20, in estimates of F. O. Licht, as 5,587,000 metric tons, which compares with 5,248,000 metric tons in the preceding year, 1939-40. Table I shows the F. O. Licht figures, as given by *Facts About Sugar*, for various European countries in 1940-41 and 1939-40, omitting Germany and France for which there are no official figures.

Table I.—Production of Sugar by Countries, 1939-40 and 1940-41

Country	1940-41 metric tons	1939-40 metric tons	Country	1940-41 metric tons	1939-40 metric tons
U.S.S.R. . . .	2,700,000	2,540,000	Yugoslavia . .	130,000	119,000
Great Britain .	520,000	536,000	Rumania . . .	110,000	145,000
Italy	500,000	478,000	Turkey	110,000	105,000
Sweden	300,000	311,000	Eire	100,000	65,000
Netherlands . .	285,000	242,000	Slovakia . . .	70,000	54,000
Belgium	280,000	264,000	Bulgaria . . .	38,000	25,000
Denmark	240,000	252,000	Switzerland . .	16,000	14,600
Spain	180,000	82,000	Finland	8,000	15,000

France normally produces 85% of its sugar requirements and imports 15% from colonies. Owing to the war, it was reported,

¹Metric ton 2,204.6 lb. Short ton 2,000 lb. Long ton 2,240 lb.

France faced a sugar shortage in 1941, as did Norway, Finland, Greece and Switzerland.

Cuba again produced a surplus sugar cane crop in 1940 and again faced an acute problem of finding markets. Up to Sept. 30, 1940, Cuba had exported 1,767,936 long tons of sugar, leaving 1,574,260 long tons available for export and home consumption.

The 1940 United States sugar beet crop, estimated by the department of agriculture Nov. 1 as 11,633,000 short tons, slightly exceeded the previous record crop of 11,615,000 tons in 1938. The 1939 crop was 10,773,000 tons and the ten-year (1929-38) average was 8,937,000 tons. The yield in 1940 was 12.7 short tons per acre compared to 11.7 in 1939 and 11.3 for the ten-year average. Sugar cane production in the United States in 1940 was estimated at 4,671,000 short tons compared to 5,798,000

Annual Death Rates from Suicide per 100,000 Total Population in Certain Countries for Specified Years

Country	Year	Death Rate per 100,000	Country	Year	Death Rate per 100,000
Austria	1937	38.1	Ireland, Northern	1938	4.2
Australia	1938	10.8	Italy	1938	7.2
Belgium	1937	17.8	Japan	1936	22.0
Bulgaria	1936	10.0	Lithuania	1937	8.7
Canada	1939	8.6	Netherlands	1938	8.5
Czechoslovakia	1937	27.5	New Zealand	1938	12.4
Denmark	1938	20.8	Norway	1937	6.0
Eire	1938	3.3	Portugal	1937	10.7
England and Wales	1938	12.9	Rumania	1937	10.3
Estonia	1937	23.0	Scotland	1938	9.2
Finland	1938	18.8	Spain	1935	3.9
France	1939	19.5	Sweden	1939	16.7
Germany	1936	28.6	Switzerland	1938	24.6
Hungary	1937	32.0	United States	1938	15.2

was only 4.8 per 100,000; the corresponding rates in 1937 were 16.1 and 4.8 respectively. Suicide death rates are appreciably higher among males than among females. Thus, the death rates in the United States in 1938 for white persons were: males, 25.4; females,* 7.3.

Sulphur. The United States is the outstanding sulphur producer of the world, with about three-quarters of the entire output. Italy is a poor second, with one-sixth, and Japan third, with one-fifteenth; all other producers are so small as to be negligible so far as the world industry is concerned.

World production reached almost 3,000,000 metric tons in 1929, dropped to 1,625,000 tons in 1932 and recovered to the former level in 1937. Italian production changed little, while that of Japan was increasing. United States production rose to a new high record of 2,742,000 long tons in 1937, decreasing to 2,091,000 tons in 1939, but shipments were 2,234,000 tons, reducing stocks to 4,000,000 tons. Exports in 1938 were 652,800 tons, chiefly to Canada, United Kingdom and Australia. (G. A. Ro.)

Sumatra, which lies northwest of Java and which is closely adjacent to the Malay peninsula along its north-western coast, is after Java the richest and after Borneo the largest of the islands of the Netherlands Indies archipelago. Its area is 163,145 sq.mi.; population (1930) 8,238,570. It is almost bisected by the Equator, lying between 5° 4' N. and 5° 59' S. It contains a long mountain range called the Bukit Barisan ("array of mountains") of which Mount Indrapura has an elevation of 13,700 ft. and Mount Ophir of 10,483 ft. The arable regions of the island are divided between native rice culture and European plantations which specialize in rubber and coffee. The mineral resources of Sumatra include coal, oil, gold and silver. It shared in 1940 in the general drive to make the Netherlands Indies more self-sufficient and more capable of supplying its own industrial needs since this huge colonial empire was thrown on its own resources by the German occupation of the Netherlands. High-octane gasoline plants for refining oil were set up and the industrial program for Sumatra included the construction of a smelter for producing aluminium oxide from bauxite, an aluminium-rolling and wire-drawing mill and an aluminium-ware factory, besides a major chemical plant and a paper mill. (W. H. CH.)

Table II.—Sugar Beet Production by States, 1939 and 1940

State	1940 short tons	1939 short tons	State	1940 short tons	1939 short tons
California	2,620,000	2,699,000	Nebraska	972,000	790,000
Colorado	1,927,000	1,543,000	Wyoming	550,000	539,000
Montana	1,134,000	804,000	Utah	470,000	683,000
Michigan	1,062,000	1,033,000	Ohio	366,000	363,000
Idaho	1,058,000	985,000	Other states	1,474,000	1,244,000

short tons in 1939 and the ten-year average of 4,096,000 short tons. The yield in 1940 was the same as for the ten-year average, 17.4 tons per acre, a sharp decline from 22.5 tons per acre in 1939. Sugar produced from the 1940 cane crop was estimated, 96 equivalent, at 408,000 short tons compared to 507,000 tons in 1939 and the ten-year average of 326,000. Of the 1940 crop of sugar cane, 3,824,000 short tons were produced in Louisiana and 847,000 tons in Florida. In 1939 Louisiana production was 5,084,000 tons and that of Florida 714,000 tons. (S. O. R.)

Suicide Statistics. During 1938 there were 19,802 deaths from suicide in the United States; these constituted 1.4% of the deaths from all causes and resulted in a death rate of 15.2 per 100,000 of total population. In the same year Canada had 946 deaths from suicide and the death rate was 8.5 per 100,000; for England and Wales, the corresponding figures were 5,316 and 12.9 per 100,000 respectively. For each of these countries, the average annual death rates for the period 1935-37 were somewhat lower than those observed for 1938. Provisional records for the United States indicate that the death rate from suicide in 1939 was appreciably lower than that for 1938; current indications for the first half of 1940 point to a suicide death rate not essentially different from that for 1939.

Death rates from suicide in the most recent year available for a number of countries will be found in the appended table. Austria headed the list with a rate of 38.1 per 100,000 total population in 1937, followed closely by Hungary (32.0 in 1937), Germany (28.6 in 1936), Czechoslovakia (27.5 in 1937) and Switzerland (24.6 in 1938). Estonia, Japan and Denmark rank next in order, all with suicide rates of more than 20 per 100,000. Only three countries, Eire, Northern Ireland and Spain have recorded suicide death rates of less than 5 per 100,000 total population.

In view of the current international situation, it is interesting to observe that in the World War of 1914-18, the death rates from suicide in the principal participating countries fell below the levels prevailing in the years of peace immediately preceding and following hostilities. Whether the same experience will be found in the countries engaged in the conflict which began in 1939 remains to be seen.

When the suicide death rate in the United States for 1938 was analyzed according to race, white persons were found to have a rate of 16.4 per 100,000 population, while that for Negroes

Sun: see ASTRONOMY.

Sunday Schools.

The World's Sunday School association is a federation of 51 national and international bodies interested in Christian religious education through the Sunday school and allied agencies. At Oslo, in 1936, a survey reported 369,510 Sunday schools in 129 countries, with 3,145,895 teachers and 34,139,624 scholars.

The quadrennial meeting of the council of the W.S.S.A., transferred from Durban, South Africa, because of war conditions, was held at Lake Mohonk, New York, May 8–11, with representatives of 20 countries present. Sir Harold Mackintosh, Halifax, England, was re-elected president, and Dean Luther Allan Weigle, Yale university, chairman of the council and board of managers. Dr. James Kelly, Glasgow, and Dr. Forest L. Knapp, New York, were elected general secretaries. Plans were initiated for an International Congress on Christian Education, to be held in Mexico, July 16–20, 1941.

The International Council of Religious Education, including 48 Protestant denominations in the United States and Canada, at its annual meeting in February, adopted a comprehensive report on basic philosophy and policy; and this has been published under the title *Christian Education Today*. The passage by the New York legislature of a law authorizing the release of public school pupils, at their parents' request, for stated periods of religious instruction, and the decision of the school board of New York city to accede to such requests, aroused new interest in the perplexing problem of how best to relate religious faith to public education, maintaining religious freedom.

In Europe the work of the Sunday schools was gravely hampered by war conditions. The Austrian Sunday School union was obliged to disband, and work in Albania ceased with Italian occupation. In Czechoslovakia, Finland and Poland work was concerned largely with the relief of refugees. The South African Sunday School union celebrated its 25th anniversary, and the Sunday School Promotion league at Shanghai, maintained by young Chinese laymen, its 20th anniversary. (L. A. WE.)

Sunshine: see METEOROLOGY.

Superphosphates. The bulk of the phosphate rock output of the world is used in the production of superphosphates for fertilizer manufacture, of which there are three standard grades, containing 16%, 32% and 45% of available phosphoric acid. World production of superphosphates is of the order of 16,000,000 metric tons, as compared with 12,000,000 tons of phosphate rock. The chief producing countries and their percentages of the total are as follows: United States 25%; Japan 13%; Italy 9%; France 9%; Australia 8%; U.S.S.R. (Russia) 8%; Germany 7%; and Netherlands 3%; totalling 82%. Intermediate producers, ranging from 500,000 tons down to 100,000 tons, include New Zealand, Denmark, Belgium, Spain, Sweden, Poland, South Africa and Latvia, totalling 16%. The remaining 2% is scattered among 14 minor countries. U.S. production in 1939 was 3,801,000 short tons, a rise of 6% from 1938, increasing to 4,200,000 tons in 1940. In 1938 58% of the phosphate rock was used in the production of superphosphates. (G. A. Ro.)

THIS NEW OFFICIAL PHOTOGRAPH of the U.S. supreme court was made necessary by the appointment of another associate justice, Frank Murphy, in 1940. In the front row, left to right, are Associate Justices Roberts and McReynolds, Chief Justice Hughes, Associate Justices Stone and Black. In the rear row are Associate Justices Douglas, Reed, Frankfurter and Murphy.

Supreme Court of the United States.

The year 1940 commemorated the 150th anniversary of the supreme court. Following are some of the decisions of 1940:

Administrative Law.—The court held that there may not be judicial review of determinations by the secretary of labour under the Walsh-Healey act which governs labour conditions in companies receiving government contracts (*Perkins v. Lukens Steel Co.*, 310 U.S. 113); or of a presidential proclamation increasing a duty under the flexible tariff provisions of the Tariff act of 1930 (*United States v. George S. Bush & Co., Inc.*, 310 U.S. 371); or of orders of the National Labor Relations board with respect to the election of collective bargaining representatives or the certification of such representatives by the labour board. With respect to judicial review of orders of the National Labor Relations board, the court held that the statutory review provided by section 10(f) of the Wagner act is restricted to orders prohibiting unfair labour practices and that representation proceedings are no concern of the courts (*N.L.R.B. v. Waterman S.S. Co.*, 309 U.S. 206).

The responsibility of the administrative agencies to congress rather than the courts, except where congress has specifically provided for judicial review of administrative determinations, was emphasized in an opinion in a case involving the Federal Communications commission. The United States court of appeals for the District of Columbia had reversed denial by the Federal Communications commission of an application for a permit to construct a radio broadcast station, but the supreme court upheld the Federal Communications commission (*Federal Communications Commission v. Pottsville Broadcasting Co.*, 309 U.S. 134).

Civil Rights.—Personal rights of individuals with respect to freedom of speech, press and religion were protected by the court in all instances in which individuals claimed violation of such rights in criminal proceedings. Handbill ordinances of three cities which prohibited the distribution of handbills, circulars, pamphlets, etc., in streets and alleys of the cities, were found to abridge freedom of the press and freedom of speech in violation of the due process clause of the 14th amendment to the constitution (*Young v. California*, 308 U.S. 147); (*Snyder v. Milwaukee*, 308 U.S. 147); (*Nichols v. Massachusetts*, 308 U.S. 147).

An ordinance in a New Jersey municipality prohibiting house-to-house distribution of literature without a permit from municipal authorities was held an unconstitutional abridgement of freedom of the press (*Schneider v. The State [Town of Irvington]*, 308 U.S. 147). A Connecticut statute prohibiting solicitation for religious contributions without approval was likewise held to be unconstitutional as censorship of religion (*Cantwell v. Connecticut*, 310 U.S. 296). Finally, the court sustained a state regulation requiring its pupils in the public schools on pain of expulsion to participate in a daily ceremony of saluting the national flag while reciting the pledge of allegiance (*Gobitis v. Minersville School District*, 310 U.S. 586).

On the other hand, a state may, by legislation, provide for the commitment of psychopathic persons without a denial to them of their constitutional safeguards (*Minnesota ex rel. Pearson v. Probate Court*, 309 U.S. 270).

Copyright.—The court ruled that the principle requiring apportionment of profits in cases of patent infringement is applicable to copyright infringement; that is, that an infringer shall be liable for "all the profits which the infringer shall have made from such infringement" (*Sheldon et al. v. Metro-Goldwyn Pictures et al.*, 309 U.S. 390).

Criminal Law.—The criminal prosecution provisions of the Texas Anti-Trust law were upheld despite the claim that such exemption from the criminal provisions accorded agricultural products and livestock while in the hands of the producer or raiser is a denial of equal protection of the laws in violation of the 14th amendment. In sustaining the Texas law, the court overruled an earlier case containing an identical exemption. The opinion states that the earlier case (*Connolly v. Union Sewer Pipe Co.*, 184 U.S. 539) "has been worn away by the erosion of time, and we are of the opinion that it is no longer controlling" (*Tigner v. Texas*, 310 U.S. 141).

Labour.—Probably the most important labour case from the standpoint both of public interest and of effect on future litigation was *Apex Hosiery Co. v. Leader* (310 U.S. 469). In that case the court held that the Sherman

Anti-Trust act was not applicable to a sit-down strike, even though it resulted in substantially restraining the interstate transportation of the product of the plant. Labour unions are liable under the anti-trust laws, according to this decision, only when their activities have the purpose or the effect of so interfering with free competition in business transactions as to restrict production, raise prices or otherwise control the market to the detriment of purchasers.

The court sustained the National Labor Relations board in a number of salient points: An order certifying a union as collective bargaining representative under section 9(c) of the act (*A.F. of L. v. National Labor Relations Board*, 308 U.S. 401) and an order directing a "run-off" election in a representation proceeding under section 9(c) (*National Labor Relations Board v. International Brotherhood of Electrical Workers*, 308 U.S. 413). It also held that a circuit court of appeals, reviewing an order in a consolidated proceeding involving unfair labour practice and employee representation, had no authority to modify the labour board's direction of election in the representation proceeding by requiring that an independent union be included on the ballot at an employee election with two national unions (*National Labor Relations Board v. Falk Corp.*, 308 U.S. 453).

Only the labour board can institute proceedings to punish a recalcitrant employer for contempt (*Amalgamated Utility Workers v. Consolidated Edison Co.*, 309 U.S. 261). The board can also order an employer to cease giving effect to contracts entered into with individual employees through a collective bargaining committee (*National Licorice Co. v. National Labor Relations Board*, 309 U.S. 350). The jurisdiction of the board has been held to extend to a company (engaged in the dyeing and finishing of textiles) even though it does only about 1% of the national total business in the industry (*National Labor Relations Board v. Bradford Dyeing Assn.*, 310 U.S. 318).

Anti-picketing laws were declared unconstitutional in two cases as an impairment of freedom of speech and of the press in violation of the due process clause of the 14th amendment (*Thornhill v. Alabama*, 310 U.S. 106; *Carlson v. California*, 310 U.S. 85).

However, in *Milk Wagon Drivers' Union v. Lake Valley Farm Products, Inc.* (311 U.S. 91), secondary boycott was, for the first time, legalized. In that case it was held that picketing of cut-rate milk stores by a union of milk delivery men to protect union wage scales and working conditions against the threat resulting from competition of cut-rate dairy selling only to cut-rate stores through independent contractor drivers may not be enjoined. Although the picketing constituted an interference with interstate commerce in violation of the Anti-Trust act, it was not subject to injunction because a labour dispute was involved.

Another decision held that all employees of interstate motor carriers other than those whose work affects safety of operation are subject to the provisions of the Fair Labor Standards act of 1938 (*United States v. American Trucking Associations, Inc.*, 310 U.S. 534).

Not since the *Fansteel* case outlawing sit-down strikes did the labour board receive so severe a reversal as in the *Republic Steel* case (*Republic Steel v. National Labor Relations Board*, 311 U.S. 7). In that case the supreme court held that no punitive measures or fines may be devised by the board and imposed on employers, even though the board may think that their imposition would effectuate the policies of the Labor act. The power conferred on the board to order employers to take "affirmative action" to remedy violations, although broad, has not yet reached this extreme.

Taxation.—*Federal.*—Tax evaders were strongly reminded by the supreme court that "technical considerations, niceties of the law of trusts or conveyances, or the legal paraphernalia which inventive genius may construct as a refuge from surtaxes should not obscure the basic issue" (*Helvering v. Clifford*, 309 U.S. 331). Nor is "the government required to acquiesce in the taxpayer's election of that form for doing business which is most advantageous to him" (*Higgins v. Smith*, 308 U.S. 473). The court set forth the requirements for avoiding applicability of the rule taxing a husband on income payable to his divorced wife in lieu of alimony. A taxpayer seeking to escape taxation of the income from an irrevocable trust agreement executed in favour of his wife prior to a divorce decree must establish that the law of the state, in which the divorce decree was entered, and the alimony trust fully discharge him from his obligation to support and maintain his wife (*Helvering v. Fitch*, 309 U.S. 149; *Helvering v. Fuller*, 310 U.S. 69). On the other hand, the failure of a taxpayer to show by clear and convincing proof that the court, which approved the trust as part of its divorce decree, gave him a full discharge of his obligation of support and lacks the power to add to his personal obligations in any circumstances, renders him taxable (*Helvering v. Leonard*, 310 U.S. 80).

The court denied a tax-exempt status to a transaction whereby all the profits of a corporation were conveyed to another corporation in consideration of cash and bonds of the transferee, all the assets of the transferor being distributed to its sole stockholder (*Le Tulle v. Scofield*, 308 U.S. 415).

State and Local.—The court greatly restricted the scope of the commerce clause of the constitution to prevent evading local sales tax by placing orders in interstate trade. Although the taxpayer purchases a commodity outside the state for shipment within the state, the court held in a series of cases that such interstate commerce must pay its way (*McGoldrick v. Berwind-White Coal Mining Co.*, 309 U.S. 33). A state or local tax is not unconstitutional unless it has such a "regulatory effect" as to prove discriminatory. The fact that such a tax does, in some measure, affect interstate commerce or increase the cost of engaging in such commerce does not make the tax unconstitutional (*McGoldrick v. Felt & Tarrant Mfg. Co.*; *McGoldrick v. A. H. Du Grenier, Inc.*, 309 U.S. 70; *McGoldrick v. Compagnie Generale Transatlantique*, 309 U.S. 430).

In the fifth case, however, levy of the New York tax was held to be an unconstitutional infringement of congressional regulation of foreign commerce. The tax in this case was applied to fuel oil sold and delivered as ships' stores to vessels engaged in foreign commerce after manufacture from crude oil imported under bonds given by the importer under customs laws and regulations. Exemption from state taxation, the opinion reasoned, "is implicit in the congressional regulation of commerce presently involved" (*McGoldrick v. Gulf Oil Corp.*, 309 U.S. 21).

Trade Regulation.—For the first time by direct decision, the court found that the constitution grants to congress power to fix prices of commodities generally where the sales are in or affect interstate commerce. The issue

arose in a case involving the constitutionality of the Bituminous Coal act of 1937. The authority to exercise this power, the court determined, does not depend on the existence of a threat to health and morals or a question of conservation of resources.

Those matters relate only to consideration of policy and are no concern of the courts.

In the so-called "Madison Oil case," involving the first criminal prosecution under the Anti-Trust law, the court held that section 1 of the Sherman act was violated by the adoption by a group of oil companies of a program of buying up "distress" gasoline at what was purported to be the fair market price in order to avoid the adverse effect on the price of gasoline generally of the sale of "distress" gasoline at "distress" prices. The court found from the evidence that the "real and ultimate" purpose of the combination was to raise the price of gasoline to jobbers and consumers (*United States v. Socony-Vacuum Oil Co., Inc.*, 310 U.S. 150).

The Sherman act also limits the "monopolistic powers" granted by the patent laws to a patentee. This was made clear in another case which also involved the sale of gasoline. The court ruled that a corporation holding patents covering a gasoline anti-knock compound, by inserting in refiners' licences a provision prohibiting the sale of treated gasoline to jobbers not licensed by the patentee corporation, had exceeded the limited monopoly granted it by the patent laws. By such practice it violated the Sherman Anti-Trust act in that the jobber-licensing system gave the corporation power to control prices and market practices of jobbers (*Ethyl Gasoline Corp. v. United States*, 309 U.S. 436). (See also *EDUCATION: Court Decisions.*) (B. We.)

Surgery. **Chemotherapy.**—During 1940, as might be expected, the application of chemotherapy was widely extended including not only its use when infections have developed, but also as a prophylactic agent against the onset and development of infection. A striking example is the treatment of compound fractures of bones. In compound fractures most bacterial growth can be inhibited by the use of sulphanilamide placed in direct contact with the soft tissues. There is no deleterious effect of the drug as far as healing of the fracture is concerned. This method of introducing sulphanilamide and other agents with similar antiseptic properties into wounds obtained during battle has become almost a routine procedure. Supplementing this, the drug is given by mouth in doses sufficient to maintain a safe concentration of it in the blood and tissues.

A new drug, sulphathiazole, was used extensively in the treatment of staphylococcal infections and was particularly efficacious in the treatment of such bone infections as osteomyelitis. It likewise has been of value in other types of infection, both local and general, even in cases of septicaemia (blood poisoning) in which the staphylococcus is the infecting organism.

Some of the disadvantages of sulphanilamide are the nausea and discomfort which some patients experience. A related chemical agent, sulphapyridine, was found to have properties similar to those of sulphanilamide, and in many cases of pneumococcal pulmonary infections it proved to be of even greater value. In doses necessary to achieve results it seemed to be tolerated better by the patient than sulphanilamide.

These three chemical compounds have likewise been used in other types of infections and have obtained noteworthy results in certain types of infections of the urinary tract, peritoneum (peritonitis) and in certain milder infections.

Vitamins.—The use of vitamins as replacement and substitution therapy in all types of cases in which haemorrhage is a factor, both operative and nonoperative, especially in those cases in which the vitamin deficiency has resulted from disturbances of the biliary or gastro-intestinal tract, has continued to be of great value in preventing serious bleeding, improving the patient's nutritional status and assisting in his recovery from certain surgical operations.

Synthetic compounds with vitamin K activity (anti-haemorrhagic) are available. These compounds can be given effectively by injections into the body as well as by mouth. Experimental work has shown that large doses of ascorbic acid are of value in assuring proper healing of wounds.

Plasma and Serum Transfusions.—Generally speaking, in the treatment of shock as the result of the loss of blood, transfusions of blood are of life-saving importance. There are other conditions in which shock occurs in which the loss of erythrocytes and haemoglobin is a secondary consideration, whereas the loss of serum and plasma produces a state of protein depletion which can be compensated for by the transfusions of plasma or serum. Such conditions are those associated with extensive burns and, in certain cases, with intestinal obstruction.

Plasma and serum transfusions have the advantage over blood transfusions in that they can be used in all cases regardless of the patient's blood group, and also that plasma and serum can be dried, stored and easily transported. Under these circumstances, when plasma or serum is given, all that is necessary is that it be dissolved in a small quantity of sterile physiologic salt solution. Its great value, therefore, under circumstances of necessity asso-

ciated with large numbers of casualties, either military or civilian, is apparent.

Oxygen Therapy.—The use of oxygen, by tent, catheter or mask, has been of great value in cases of oxygen depletion associated with pneumonia or other conditions in which absence of oxygen from the blood produces cyanosis. Two innovations in oxygen therapy—the administration of high concentrations of oxygen and the administration of helium and oxygen—were made possible by the development of a special apparatus.

The first procedure is used in cases in which oxygen lack is due to sluggish peripheral circulation, as in surgical and traumatic shock, and in which the increase in the amount of oxygen in the arterial blood made by the inhalation of high concentrations of oxygen is of value. In such a group would be cases in which gas is trapped in the body, such as in distension of the intestine with nitrogen, in gas gangrene, in surgical emphysema and in air embolism. In cases of severe anoxaemia an apparatus of the type of the B.L.B. mask enables the administration of high concentrations of oxygen not obtainable in the oxygen tent. In certain cases in which extensive surgical procedures have been necessary, increasing the normal oxygenation of the blood accelerates healing of the operative site, and abdominal distension and shock are reduced to a considerable degree.

The administration of helium, in combination with oxygen, has been particularly effective in combating the effects of conditions producing obstruction of the upper air passages.

Other Procedures.—Attempts were made to reduce the crippling effects of arthritis on the joints of the extremities by performance of surgical procedures in which the joint is opened and calcium deposits limiting its motion are excised. Remarkably good results were reported in many such cases. Since successful results followed removal of the patella (knee cap) when badly fractured, its removal has been advocated and carried out in certain types of arthritis of the knee joint.

In certain cases in which a constricting thick layer of scar tissue, sometimes infiltrated with calcium, occurs around the heart, cardiac efficiency is reduced and tissue fluids accumulate in various parts of the body from circulatory stasis. Removal of the constricting tissue from the heart has been successfully carried out, with restoration of cardiac efficiency to a remarkable degree.

Since it has been shown that free skin grafts function and grow for as long as eleven years after operation, the method of taking large skin grafts of full thickness from the abdomen or back and applying them to other areas of denudation has been so successful in the number of "takes" that it has been used with great advantage in grafting denuded areas about the face and neck from which a tumour or scar tissue, producing contracting deformities and unsightly scars, has been excised. Surinam (DUTCH GUIANA), a Netherlands colony in north-eastern South America; area, 54,291 sq.mi.; language, Dutch; capital, Paramaribo; governor, Dr. J. C. Kielstra. The population on Jan. 1, 1940, was 156,332 besides an estimated 19,032 bush Negroes and 2,616 Indians in the jungle. The chief cities are Paramaribo, 54,853, and Nieuw Nickerie, 3,788. The population in 1937 was 29.2% British Indian and 20.3% Javanese by nationality. There is an appointed governor and an elected council.

History.—German invasion of the mother country in May 1940 and the subsequent collapse of France brought grave problems to Surinam. Escaped convicts from French Guiana became a serious threat, while the Netherlands' own precarious position left Surinam, long supported in part from the home government's budget, in a bad economic and financial position. Potential attack from overseas loomed large in the eyes of many, and proposals were made that the United States establish naval and air bases for its own and Surinam's security.

Communications.—External communication is by steamship and air service. Internal communications are good along the coast where there are 137 km. of railway and fairly good roads, but are very poor in the interior.

Trade.—In 1939, imports, chiefly manufactured goods and foodstuffs, were valued at 7,882,353 guilders, 14.7% more than in 1938 (Netherlands, 34.5%; United States, 30%). Exports were 7,959,210 guilders, a 20.5% increase (United States, 71.8%; Netherlands, 16.3%). Bauxite, exported to the United States, was 64% of the export value in 1939 and was expected to be con-

siderably greater in 1940.

In 1939, bauxite export volume was 504,062 tons. Gold and silver exports were valued at 629,294 guilders. Sugar (11,740 tons in 1939), balata, molasses, coffee, coco-nuts, peanuts, bananas, corn, peas, oranges, tobacco and rice are the main agricultural products.

Finance.—In 1939 government expenditures were 6,962,014 guilders; revenues, 4,034,476 guilders; the deficit being made up by the home government. The monetary unit is the guilder, officially valued at 52.8 cents U.S., and, since May 1940, tied to the Netherlands East Indies currency.

Education.—There are 132 schools (43 government), besides Indian and bush Negro schools in the jungle. On Jan. 1, 1940, there were 21,278 school children, 10,178 of whom were in the rural districts.

Sweden, democratic monarchy of northern Europe. Area 173,347 sq.mi.; pop. (Dec. 31, 1939) 6,341,303. Chief towns (Dec. 31, 1939): Stockholm (583,621), Göteborg (280,601), Malmö (154,270), Norrköping (70,379). Ruler: King Gustavus V; language, Swedish; religion: Lutheran Christian.

History.—Sweden succeeded throughout 1940 to continue to walk the tightrope of peace, although completely surrounded by states involved in conflict or occupation by foreign troops. A large part of Sweden's army remained mobilized through the year, and its Bofors anti-aircraft guns, reputedly best in the world, shot down over 50 warplanes, mostly German, which for one reason or another had crossed the Swedish frontier. Naval defence was strengthened by the addition of some 60 vessels, such as motor-boats and minesweepers. Sweden wanted planes, but 110 pursuit planes and bombers ordered in the United States were taken over by the United States government and transferred to Canada. A year's defence costs mounted to about 1,500,000,000 kronor by June, and came to about 200,000,000 kronor per month.

The Swedes have long regarded Finland as their first line of defence against their hereditary enemy Russia. Hence it was not too surprising that their national contribution to the Finnish cause in 1939-40 rose to over 500,000,000 kronor, and that several thousand volunteers bolstered the Finnish lines. Nevertheless Sweden refused to allow Allied troops to cross her territory or to send the 60,000 men asked from her. She had to watch the Russians advance into the eastern parts of Finland and establish themselves in naval and air bases all along the eastern shores of the Baltic.

On the 9th of April Sweden saw her western neighbours Denmark and Norway attacked. Fearful herself of the German juggernaut, with armament stores depleted by aid to Finland, and with one never-sleeping eye watching the U.S.S.R., Sweden felt she could do little for Norway. A few shipwrecked Germans passed through Sweden to Germany, and after the fighting in Norway was over, German soldiers and supplies were allowed to use Swedish rail facilities. Swedish sympathies were all with Norway, and several hundred prefabricated houses were sent to rebuild devastated towns.

Although Sweden kept out of the fighting, the war came to affect her severely. The struggle around Narvik in northern Norway destroyed the chief export route of Swedish iron ore; and after April the double blockade by Germans and British effectively cut off this insular neutral from her important trade with Britain, western Europe and the Americas. Through the tiny loophole on the Arctic in northern Finland persons could make

their way out, but most travelled through Russia the long route via Vladivostok. Bulk goods could not move through these costly and dangerous routes. Sweden adjusted herself to circumstances by making new trade agreements with Germany, and through Germany with Belgium and the Netherlands; she also extended a 100,000,000 kronor credit to soviet Russia in a two-year trade agreement. Possibly thus she could replenish her low stocks of coffee and sugar and obtain more oil and gasoline (consumption was down to 10% of pre-war, cars burning charcoal gas made in little trailer-cars). Poor crops of grain and hay accentuated Sweden's food and fodder problem.

Life and thought in Sweden remained comparatively free, though an editor was forced into retirement and an occasional issue of different papers was confiscated. In February the state set up a bureau of information to help unify the people and make them understand government policy. In the elections of September the discredited communists lost two seats in the riksdag and the Socialists disappeared. The voting evidenced confidence in the Social Democrats, who won 19 new seats for a clear majority in the second chamber, and exactly half of the membership of the first chamber. Most significant was that the vote gave the accolade of popular approval to the government's foreign policy. The riksdag (parliament) remained in constant session, keeping democratic control of the emergency measures of the government.

Education and Religion.—Scholars, elementary (1937), 581,131; continuation schools, 147,422; middle and secondary schools, 71,525; universities (1939), 8,521.

Banking and Finance.—One krona=23.855 cents (45.3740 cents at par). At the end of 1940 the Swedish riksbank held 672,000,000 kronor in metals and 750,000,000 kronor in foreign exchange; total of 1,422,000,000 kronor. State finance, 1939-40: ordinary budget, 2,767,150,300 kronor; capital budget, 525,563,400 kronor; 1940-41 (est.), ordinary, 1,663,626,300 kronor. Public debt (Dec. 31, 1939) 2,664,289,387 kronor.

Trade and Communication.—The year 1940 witnessed a general reorientation of trade; few statistics are available. Approximately 15-20% reduction in foreign trade. Sweden registered 70 new ships, including 37 motor vessels (of 80,000 tons) manufactured in Sweden, but this did not compensate for war losses. Gross tonnage (Jan. 1, 1940), 1,622,042. The import surplus for the first six months of 1940 was 450,000,000 kronor, caused by building up reserve stocks. 1939 trade: imports, 2,488,891,000 kronor; exports, 1,879,274,000 kronor.

Sweet Potatoes. The 1940 crop of sweet potatoes was placed at 66,131,000 bu. in preliminary estimates by the department of agriculture. Production in 1939 was 72,679,000 bu. and the ten-year (1929-38) average was 72,436,000 bushels. Reduction in planting caused the smaller

Sweet Potato Production by States, 1940 and 1939

	1940 bu.	1939 bu.		1940 bu.	1939 bu.
North Carolina	7,592,000	8,624,000	New Jersey	1,920,000	2,325,000
Georgia	6,930,000	8,892,000	Oklahoma	1,520,000	945,000
Alabama	5,850,000	8,800,000	Maryland	1,450,000	1,440,000
South Carolina	5,610,000	6,834,000	California	1,440,000	1,200,000
Louisiana	5,490,000	6,935,000	Florida	1,235,000	1,140,000
Mississippi	5,390,000	6,142,000	Missouri	1,050,000	1,105,000
Tennessee	4,800,000	3,713,000	Delaware	650,000	675,000
Texas	4,428,000	3,780,000	Illinois	560,000	528,000
Virginia	4,030,000	4,128,000	Kansas	330,000	240,000
Arkansas	3,150,000	2,680,000	Indiana	285,000	315,000
Kentucky	2,160,000	1,968,000	Iowa	255,000	270,000

crop, as the yield per acre in 1940 was 83 bu., compared with 84.3 bu. in 1939 and a ten-year average of 84.6 bushels. (See also POTATOES.) (S. O. R.)

Swimming. War greatly curtailed competitive swimming activities in 1940. Not only were noted stars of many countries called to service and forced to drop out of sports, but several European nations decided to cancel their annual championships, a number of customary inter-country encounters had to be abandoned and some proposed foreign tours were made impossible. Record breaking continued, however, and foremost were the amazing feats of Miss Ragnhild Hveger, of Denmark. She shattered three of her own striking world's marks, reducing the time for 400 m. free style from 5 min. 6.1 sec. to 5 min. 5 sec., 1,000 m. from 14 min. 12.3 sec. to 14 min. 9.2 sec. and 1,500 m. from 21 min. 45.7 sec. to 21 min. 10.1 sec.

Four world's standards for men were bettered in the United States. Adolph Kiefer lowered the back stroke figures for 100 yd. from 58.8 sec. to 58.1 sec. and 100 m. from 1 min. 4.8 sec. to 1 min. 4.7 sec., while varsity teams clipped free style relay marks, a Michigan four cutting that for 400 yd. from 3 min. 31.3 sec. to 3 min. 30.7 sec. and a Yale quartet that for 400 m. from 3 min. 59.2 sec. to 3 min. 54.4 sec.

Japan's swimmers, international leaders since 1932, failed to show their usual prowess. In no national title event, except the 100 m. back stroke, did they equal the winning time of 1939.

Argentina and Brazil became increasingly prominent aquatic centres, extending invitations to champions of various countries and inducing teams from the United States and Japan to participate in some of their important carnivals.

Hungary, victor in water polo at the last three Olympiads, but defeated by Germany in 1939, turned the tables in the summer of 1940 and again was acclaimed world topnotcher at the game.

The swimmers of Hawaii, who sprang so startling a surprise in outscoring all mainland teams in the national outdoor championships of the United States in 1939, not only repeated their victory, but won by a greater margin. (L. DE B. H.)

Switzerland, a confederation of west-central Europe, member of the League of Nations, bounded N. and E. by Germany, S. by Italy and W. by France. Area 15,944 sq.mi.; pop. (est. 1940) 4,200,000. Chief towns: Berne (cap. 121,976), Zürich (329,780), Basle (162,559), Geneva (123,286), Lausanne (89,632). Government: republican confederation of 22 cantons, joined together by the federal constitution of May 29, 1874, but with large powers of local control retained by each canton; central executive, a federal council of seven members; president (Jan. 1, 1941), Dr. Ernest Wetter. Languages (census 1930): German 2,924,314; French 831,100; Italian 242,034; Romansch 44,204, and others 24,797. Religion (1930): Protestant 2,230,536; Roman Catholic 1,666,317; Jews 17,973.

History.—The party composition of the national council, or lower house of the federal legislature of 187 members, was according to the elections of Oct. 1939, Government coalition: Radical Democrats 50; Catholic Conservatives 44; Farmers, Traders and Citizens 21; other parties: Liberal Democrats 6; Independents 9; Young Farmers and Free Democrats 6; Social Democrats 45; Dissident Socialists 4; no party 2. On Dec. 10, 1940, Dr. Ernest Wetter, head of the Swiss finance department and professor in Zürich, was elected president for 1941, succeeding Dr. M. Pilet-Golaz. Dr. Wetter came into the Swiss federal council in 1938 as a representative of the Radical Democrats who, even in conservative Switzerland, form one of the more conservative parties.

In view of the danger of subversive propaganda and internal agitation resulting from the European war, the Swiss took energetic precautions. On Aug. 6 the federal government prohibited all communist, Trotskyist and anarchist activity, and declared three-year prison terms and heavy fines for violations of the law. Sympathizers with national socialist Germany were much more

numerous and dangerous. The federal council on Nov. 19 decreed the dissolution of the Nazi party on the ground that it disturbed public order. Seven persons charged with plotting to sabotage the country's defences were condemned to life terms.

During the first eight months of the European war Switzerland had many moments of uneasiness. It was feared that the Germans might try to reach France around the southern end of the Maginot line. But the Swiss mobilized, stood firm in their mountain defences and suffered nothing worse than the occasional flight of a Nazi aeroplane across their frontier. With the French collapse in June their position became much more critical. The country was thenceforth ringed about by territory under Nazi or Fascist control. Its profitable tourist trade evaporated. It had to support thousands of refugees who poured across its frontiers from France, as well as some 60,000 French soldiers who sought protection under the Swiss flag and were interned for the duration.

Switzerland succeeded in preserving her neutrality and independence, but it was difficult. British planes frequently flew high over the country on their way to bomb Milan and other Italian cities, and in December dropped bombs, apparently by mistake, on Basle, killing several persons. The German and Italian press complained loudly and threateningly that the Swiss newspapers were pro-British because they printed British war communiqués.

Economic Conditions.—Swiss commerce with the outside world was almost cut off by the ring of axis territory around the country. Switzerland became more dependent on Germany for coal, iron and steel, and the raw materials for munitions. Food shortage compelled the government in October to take control over all bread grain stocks and to ration many other articles. The cost-of-living index rose in December to 156 (1914=100).

Table Tennis. Probably no other international sport in 1940 was as handicapped by the war as was table tennis. Of the 29 countries represented in the International Table Tennis federation, 22 were involved in the conflict as belligerents or as controlled territory. Symbolic of the destruction, the federation's headquarters, Featherstone house in London, was demolished by German aerial bombs in September. For the first time since the founding of the I.T.T.F. in Berlin in 1926, there were no world championship events, the annual meeting scheduled for Paris being cancelled; and no plans were possible for 1941. Nevertheless, despite war clouds in the far east, the U.S.A. and Australia sent teams to tour Japan on invitation of Japan's association. The English championships were held, too, spectators at the finals at Wembley being restricted to 5,000 by war-time regulations and the proceeds going to the Red Cross; the men's singles title was won by world champion Richard Bergmann, Polish-Austrian. In the U.S.A., the men's title was won at Indianapolis by a hard-hitting newcomer, Louis Pagliaro, of New York, against strong foreign contenders; New York retained the national team title; the University of Pennsylvania won the Bradley trophy back from Princeton. The playing rules were unchanged, and it became apparent that the lower net (6 in. high), adopted in 1938, made the game faster. (C. Z.)

Tactics in the European War. The European war repeated an old paradox. No new weapons and no unique tactics were used, but Germany was able to overwhelm five nations in the most astounding series of military victories since Napoleon. Germany used the different arms available to all nations more skilfully and with better appreciation of their possibilities than her opponents. This is a not infrequent phenomenon in military history. Napoleon won his incredible campaigns by taking advantage to the full of all the new possibilities of war that had been developing in the 18th century. German superiority lay in a military organization designed and properly balanced to use modern weapons to their most effective extent, to full co-ordination of all arms, to the stamina of the German soldier resulting from an exceedingly arduous training to which he had been subjected, and to the spirit of individual initiative in which the subordinate commanders had been trained.

German tactical methods were no secret, but had been debated for years in the German military publications, had been tested in Spain and finally had been crystallized in German regulations and were available to the world. While the rest of the world was debating whether or not cavalry still was an effective agency for war, Germany had discarded its cavalry and had replaced it with large numbers of tanks organized into ten Panzer (armoured, or mechanized) divisions. While the generals of more conservative armies were discussing whether aeroplanes were of any value in the direct support of infantry operations, Germany had tested the question in Spain and found them extremely valuable. A special plane even, the Stuka dive-bomber, was developed solely for this use. While the rest of the world was deluding itself concerning the impregnability of the defensive, Germany had prepared the means and developed the methods by which defensive lines could be broken. While the rest of the world laughed at parachute and air infantry as a Russian publicity stunt, Germany was remodelling thousands of old bombers and training parachutists.

Tactics in the Polish Campaign.—In Poland the German operations commenced with what might be called the standard attack procedure of the World War of 1914–18, that is, artillery preparation and infantry advance. This continued for from three to six days with the infantry moving forward from six to ten miles a day. When the Polish resistance had become weakened, the Panzer divisions, which had been brought up secretly at night, were rushed through the soft points to the rear of the Polish armies. The German armoured divisions were behind the second Polish defensive line before the Poles themselves could withdraw to it. After this they were never stopped nor headed, but continued their work of disorganization and demoralization in the Polish rear. The German infantry followed by forced marches of from 20 to 30 miles a day and surrounded the Polish armies at various localities and finally forced their surrender.

German aerial tactics in Poland in the first phase, which lasted about five days, were devoted to destroying the Polish air force and its aerodromes and to the destruction of the Polish aeroplane and armaments factories. When the German air force had gained complete control of the air, aerial attacks then were turned against the Polish railroads and marching columns of Polish troops. The destruction of railroads and the bombing of every unit found marching on the roads prevented Polish reserve formations from ever reaching the front and blocked the rearward movement of the Polish armies to new defensive positions. At the same time, aviation was used to destroy the Polish command system, and this was done so effectively that shortly they were

GERMAN PARACHUTE TROOPS were effective military and psychological factors in the 1940 conquests of the Low Countries and France. Here one is shown disengaging his chute after landing

leaderless and out of touch with those who should have co-ordinated the fighting.

When the battle lines became fluid and warfare reached the manoeuvre phase in the open, German organization of their infantry regiments as self-contained combat units equipped with their own artillery, and with divisional artillery and engineers attached, proved itself. The German regiments advanced independently without waiting for orders until they, too, were far behind the Polish armies, and the Polish soldiers, although fighting bravely, had to surrender when encircled.

Poland supplied an answer to a much debated military question, namely, the relative value of cavalry and tanks. The Polish army had maintained 40 regiments of cavalry, and had contended that on the open plains of Poland was to be found the ideal ground for cavalry operations. Against tanks and well-armed infantry, cavalry proved powerless. The horse could not dig itself into the ground to avoid machine gun fire, nor could it run fast enough or far enough to get away from the tanks. One even heard of Polish cavalry charging with lances against tanks.

Norway.—The most vital conclusion of the European war can be drawn from aerial operations in Norway. The British were able to land troops in harbours not occupied by the Germans initially, while the German air force was in Norway in small numbers, and was operating primarily in direct support of soldiers fighting in the Norwegian valleys. When German air power was turned against British landings and the efforts of the British to supply and reinforce the troops already in Norway, it was able to prevent any further reinforcement and to make the position of the British expeditionary force so precarious that it had to be withdrawn. This supplies one of the most important tactical lessons in all the history of warfare: *a continental nation properly armed has become impregnable to invasion across the sea.*

The Campaign Against France and the Low Countries.—In Holland parachute troops attempted to capture Rotterdam and The Hague, as well as several landing fields. The great Moerdijk bridge across the Maas river was captured and held by parachutists who later were reinforced by air infantry, which was disembarked from flying boats which landed in the river. In the campaign of Belgium and France, parachute troops were dropped in smaller numbers primarily for disorganization, cutting of telephone lines, to spread panic and to send information of enemy troop dispositions.

Whereas in Poland, Holland and Belgium the initial attacks were launched by infantry supported by artillery, with the armoured divisions held back until defensive lines had been broken,

in the break-through across the Meuse from Belgium into France the initial attack was launched by armoured divisions, and dive-bombers substituted for artillery in preparation for the assault. The advance of the mechanized divisions had been too fast for the infantry and artillery to keep up with them. It is not probable that initial attack by tank formations will become standard procedure, but the crossing of the Meuse shows that where the attack can be launched with surprise, aviation and mechanized forces have sufficient power to overcome very strong resistance.

The Maginot line was not captured by frontal attack. It was surrounded and captured from the rear. Although certain superficial conclusions may be drawn about the weakness of fortified lines, there is no reason to believe that a properly constructed fortified line of sufficient depth will not be able to withstand the heaviest of attacks for long periods of time. The French extension of the Maginot line, the so-called Little Maginot line running along the Belgian frontier from Luxembourg to the English channel, was only lightly fortified, and its breach proves nothing with reference to the heavily fortified lines constructed in time of peace. Tainter, Charles Sumner (1854-1940), U.S. inventor, was born in Watertown, Mass.,

April 25 and was educated in the public schools. While working as an instrument maker in Boston he became associated with Alexander Graham Bell, inventor of the telephone. The two went to Washington and organized the Volta Laboratory association where Tainter's work is said to have made phonographs commercially possible. He was the inventor of the dictograph and the hard rubber disk for the phonograph. He received a gold medal at the Paris exposition in 1881 for inventions in connection with the radiophone and in 1889 he was made an officer of public instruction by the French government, in recognition of his invention of the graphophone. He died in San Diego, Calif., April 20.

Talc. The United States talc output, which now exceeds 200,000 metric tons annually, comprises more than half of the world total; French production was formerly in excess of 80,000 tons, but during recent years has declined about one-quarter; Manchoukuo has been increasing, and now ranks ahead of France; the next producer in size is Italy, with more than 50,000 tons; Austria, Canada, China, India and Norway have outputs between 10,000 and 25,000 tons, and outputs of a number of other countries are smaller. Previous German production, mostly from Bavaria, supplied only 20-30% of the requirements, but the addition of the Austrian output will raise the total almost to self-sufficiency. Talc occurs in a wide variety of forms and grades, each of which has its own industrial uses, with the result that most countries, even those with the largest outputs, need to import some grades.

The United States produced 254,000 short tons in 1939, with net imports of 17,000 tons. This was used in paint 27%; ceramics 15%; roofing, paper and rubber each 12%, leaving 22% for a large number of minor uses. Canadian production in 1939 was 13,100 tons.

Tanganyika: see **BRITISH EAST AFRICA; MANDATES.**

Tangier. Before developments arising out of the European war Tangier, one of the zones of Morocco, was an international territory, neutralized and demilitarized, under the nominal sovereignty of the Sultan of Morocco with France as the paramount power. Following the entry of Italy into the war and the collapse of France, Tangier was "provisionally" occupied by Spanish Khalifian troops (June 14) with, it was reported, the concurrence of the French government, and with the declared intention of guaranteeing its neutrality and the affirmation of the Spanish foreign office that the international administration would be maintained and the rights of interested powers respected. On Nov. 4 the Spanish military commander, Colonel Yuste, deposed the French administrator (M. Le Fur), abolished the assembly and the international institutions, and proclaimed himself governor as a first step to the eventual annexation of the territory to Spain. Area 225 sq.mi.; pop. (est. Dec. 31, 1938) 60,000. Chief town (cap.) Tangier (pop. 45,000). Languages, official, Arabic, French and Spanish; religion: mainly Mohammedan. Trade, external (1938) imports, 94,693,830 fr.; exports, 11,380,286 fr. Finance: (est. 1939) revenue, 29,795,500 fr.; expenditure, 29,653,312 fr.; public debt, 9,566,548 fr. In 1940 there were 65 mi. of roads suitable for traffic and the port was in course of modernization. The French maintained a radio station in the capital, where also was a telephone service.

Tanks: see ARMIES OF THE WORLD; LIGHTNING WAR; MUNITIONS OF WAR; TACTICS IN THE EUROPEAN WAR; EUROPEAN WAR.

Tariffs. In the field of tariffs and commercial policies the year 1940 was marked by continued increase in the dominance of trade and exchange controls, by the elimination of several customs frontiers and by continued tinkering with tariffs which in each country are maintained as the substructure of trade control.

With the outbreak of the war in Europe in Sept. 1939 nearly every government in Europe, except those of Germany and Italy, took more or less drastic measures to restrict some or all exports or imports or both, directly or by exchange control. German and Italian trade policy was least affected as these states had long been organized as war economies. Britain and France and their empires took long strides in the direction of complete state control of trade. Led by Britain and the dominions, by the end of 1940 the British empire had gone far towards eliminating trade that did not directly contribute to the war effort. But if one is struck by the steady extension of war's restrictive effect on trade, one is also struck, in reviewing the measures, by the reluctance and slowness with which that restriction has been accepted. Throughout the empire many of the restrictive measures were, incidentally, protectionist and discriminatory against countries outside of the empire. The latter half of the year, however, saw numerous trade restrictions extended at least nominally to empire products previously exempt, and consumption of locally-produced nonessentials was being reduced by sales taxes and other devices.

At the outbreak of the war some of the Latin-American countries also passed sweeping emergency measures giving almost unlimited economic control to the executive.

In general 1940 witnessed only the increase and tightening of previous measures of control by belligerents and neutrals alike. Japan, already at war for two and one-half years, found several further ways in which to exercise state control of trade.

The characteristic war measure is the licence system, generally applied by belligerents first to imports but increasingly to exports. By June 1940 the United Kingdom had made all imports

except live quadrupeds subject to licence (including, however, some for which open general licences were granted). In September France made 12,000 items subject to export licences. Neutral countries also, including the United States, have increasingly subjected exports to licence requirements and even embargoes, though on a small scale compared to what the belligerents have done. The licensing systems of neutrals may operate either to retain within the country products considered necessary for armament and industrial development or to give the government a stronger position in bargaining with belligerents. In November Greece, which formerly controlled imports chiefly by a quota system, made all imports subject to special licences.

In the spring several Balkan states, in June Spain, and in September Yugoslavia, Finland and Spanish Morocco installed central agencies to exercise or supervise all trade controls, with more or less complete control over all trade. Sweden introduced official exchange control in February, Switzerland introduced unofficial exchange control in May, in June Ecuador reintroduced the system which had been abolished in 1937, and Venezuela strengthened its system in October. Effective Nov. 14, the legislature of Ecuador gave to the president and council practically unlimited power to take emergency economic measures.

Bilateral trade balancing continued to spread. Countries within the British blockade went over to bilateral trade balancing almost entirely, though in the latter part of the year among countries within the zone of German conquest or of military and economic pressure, there was initiated a new series of clearing agreements looking toward the development of multilateral balancing of trade through a central office in Berlin to supersede numerous bilateral clearing agreements. The war accelerated the trend in Europe toward the monopolization of foreign trade under compulsory business associations or governmental boards.

The United States took a further step toward international economic planning in the agreement signed on Nov. 28 by the United States and 14 coffee-producing countries of the western hemisphere. Its purpose was to limit and control the marketing of their coffees in the United States and elsewhere.

As usual, most of the world's 100,000 tariff rates remained stable through the year, though the total number of changes in duties may easily have run into the thousands. Bolivia alone made a general tariff revision, mostly technical. In the British empire there were widespread increases of duties ostensibly at least for raising revenue or for lessening nonessential imports. The United Kingdom imposed a third increment of 2s. a pound on tobacco, bringing the total to 15s. (\$3.00) per pound. India imposed 3% ad valorem on articles previously free. Canada and New Zealand raised the sales tax in June to 10% ad valorem, as Australia did in November. Canada exempts products of the empire and on imports from nonempire sources the Australian and New Zealand rates are roughly twice 10%, being 10% on duty-paid values plus 20% and 25%, respectively. Newfoundland waited until Dec. 1 to impose a war revenue tax of 7½% ad valorem on almost all imports from Canada, Hongkong and nonempire areas. In October the United Kingdom levied luxury taxes of 33⅓% or 16⅔% ad valorem on long lists of luxuries and other products, domestic or imported—levied on imports (as far as imports were still permitted) on the duty-paid value. Early in December, Canada made important additions to the list of products prohibited except from empire sources, including cereal foods, automobiles, furniture, silk fabrics, clothing and toys; removed or reduced duties on numerous British products; announced products to be licensed on a decreasing scale, including tobacco and raw silk; and imposed excise taxes of 20% or 25% on domestic production of some of the articles whose importation was restricted.

On the other hand, the world saw numerous decreases of duties as goods became scarce and prices rose. Several reductions or exemptions were made by the belligerents but more were made by neutrals either to ease the cost of living or, as in Uruguay and Venezuela, to reduce costs of raw materials or semimanufactures as aids to domestic manufacture; but in no country do such reductions seem to have been of great significance. In October Argentina generalized to all countries reductions made in agreements with Chile of June 1933 and Feb. 1940. Colombia extended to Argentina the reductions made to the United States in 1935. Salvador extended its minimum tariff rates to several more Latin-American states. Of great significance, if its principles are carried out on a large scale, was the agreement signed on Oct. 6, 1940, by the ministers of finance of Argentina and Brazil. They contemplated a development of complementary rather than competitive economies in their huge countries, agreeing in principle that new industries not now established in either country shall, when established, have free access to the markets of both countries, that the same objective shall be sought for industries now established in only one of the countries and for minor industries, that reduction or elimination of all duties shall be pursued as far as can be done without disturbing present production; and that similar agreements shall be made with other Latin-American countries.

Tariff barriers disappeared between Italy and Albania with the customs union of March 1940. Germany absorbed—as she had already absorbed Austria, Sudetenland, Memel and western Poland—Danzig (January), Luxembourg (August) and Bohemia and Moravia (October). In October and November the German exchange control law was extended to Lorraine and to Alsace, and the exchange barriers between them and Germany were abolished. On Dec. 16 abolition of the German customs frontier against the Netherlands was announced. The soviet union absorbed eastern Poland, the Baltic states and Bessarabia. The removal or shifting of these numerous customs frontiers in one sense extends areas of “free trade”; but the subjection of additional territories to totalitarian regimentation can scarcely be regarded as a freeing of trade.

In contrast, the Philippine islands were preparing for an independent economy. On Jan. 1, 1941, products which had benefited from free entry into the United States became subject to Philippine export duties equal to 5% of the United States import duties on similar products of other origins. (See also TRADE AGREEMENTS.)

(B. B. W.)

Tasmania, a state of the Australian commonwealth, forming an island 26,215 sq.mi. in area to the southeast of the mainland, from which it is separated by 140 mi. of Bass strait. The state governor is Sir Ernest Clark K.C.B. Population (est. Dec. 1939) 241,576. Chief towns: Hobart (cap., 65,450); Launceston (33,250).

History.—R. Cosgrove's government remained in office throughout the year 1940. State finances resulted in a balanced budget for 1939-40 compared with an estimated deficit of £58,000. No new taxes were introduced but the Land and Income Tax act was amended to abolish the wages tax and to adjust certain concessions in the income tax and special tax which would provide for a similar total amount of tax to be collected. Taxes were in future to be collected by compulsory instalments.

Agricultural and pastoral conditions were satisfactory and industrial development continued. After many years of careful planning the newsprint industry became an accomplished fact when the first unit of the mill at Boyer came into production. Its present capacity (1940) is 23,000 tons of newsprint a year.

J. Morris was appointed chief justice of the supreme court in

succession to Sir Harold Crisp. He was 37 years of age and was the youngest chief justice in Australia.

Finance.—Revenue (1939-40), £A3,055,000; expenditure £A3,053,000; public debt (June 30, 1939), £A26,366,990.

Communication.—Dec. 31, 1939: roads, surfaced c. 21,000 mi.; railways: government 658 mi.; private 132 mi. Motor vehicles licensed (Dec. 31, 1939): cars 17,705; trucks 5,100; cycles 3,549. Wireless receiving set licences (Dec. 31, 1939) 40,713. Telephones (June 30, 1939) 18,013.

Industries.—Production 1938-39: primary £A8,142,441; secondary £A5,398,659. Labour, 1938-39 average: factory employment 13,802 employees; unemployment (trade union returns) 7.1%. (W. D. MA.)

Taussig, Frank William (1859-1940), U.S. educator, emeritus professor of political economy in Harvard university, was born in St. Louis, Mo., Dec. 28 and died in Cambridge, Mass., Nov. 11. For a biographical sketch see *Encyclopædia Britannica*, vol. 21, p. 836.

Taxation. Through resort to so-called “hidden taxes,” state and federal governments had been able to raise many millions of dollars in revenue each year in the United States without seriously disturbing the complacency of the payers of such taxes. Evidence of this fact was established in the results of a nationally conducted poll by a recognized authority on the testing of public opinion. The poll revealed that 25% of the people believed that they paid no taxes.

But in 1940, feverish preparations for national defence in the United States, with congressional appropriations and authorizations for future expenditures aggregating approximately \$20,000,000,000, compelled the nation to face up to a situation that it

TAXES and federal spending were neatly beclouded as campaign issues in 1940, according to Messner of the Rochester Times-Union in his cartoon, “Smoke Screen”

had chosen to ignore for almost a decade. Revenues of the treasury would have to be substantially increased. All hope of bringing the federal budget into balance—or anything approaching a balance—through reduction of governmental expenditures vanished with the development of the defence emergency.

The first effect of the fiscal emergency was the breaking down of the last resistance in congress to a broadening of the base of the federal income tax structure. In the first revenue act of 1940, effective June 25, exemptions on individual incomes were lowered—for married persons, from \$2,500 to \$2,000; and for single persons, from \$1,000 to \$800. Thus, more than 2,000,000 persons were added to the number of income taxpayers.

An innovation in the U.S. tax system was introduced through an emergency provision of the first revenue act of 1940, establishing a "supertax" to offset in part the national defence preparedness expenditures of the ensuing five years. This "defence tax," which will expire as of Dec. 31, 1944 (unless renewed by congress), will increase by 10% the amount of annual income tax that otherwise would have been paid by each income taxpayer.

No change was made in the normal tax rate of 4%, but surtaxes were increased in the "middle brackets." Higher corporate levies were provided and also excise (so-called "nuisance") taxes were increased on such items as automobiles and accessories, insurance policies, admissions, gasoline and oils, cigarettes, beer and distilled spirits.

The purpose of the second revenue act of 1940 (approved Oct. 8), known as the excess profits tax, was twofold: (1) to produce new revenues; and (2) to avert a crop of "war industry millionaires" in the United States. The repercussions of this highly complicated and almost incomprehensible law were immediately felt in American industrial and investment circles. The uncertainties regarding its application were more disconcerting to business than the severity of its tax provisions.

In addition to excess profits taxes, the law imposes on certain classes of corporations earning more than \$25,000 a year an additional increase of 3.1% in their normal income tax, bringing their normal tax up to 24%. But in the case of corporations whose normal-tax net income is slightly in excess of \$25,000, and which are entitled to use the "alternative tax," the full 3.1% increase in normal tax is not applicable until the normal-tax net income reaches \$38,565.89. An exemption of \$5,000 is provided.

Corporations are given the choice of two methods of computing their excess profits, one based on invested capital for the year in which the tax is levied and the other on average earnings for the years 1936 to 1939 inclusive. The tax rate is graduated from 25% on the first \$20,000 excess profits to 50% on all excess profits over \$500,000.

The revenue provisions in both acts of 1940 were retroactive to the first of the year. They were admittedly only "stopgap" measures and undoubtedly will undergo radical revision in tax legislation to be undertaken by the 77th congress. The 1940 acts are expected to produce between \$1,500,000,000 and \$2,000,000,000 new revenue annually. Nevertheless, the year 1940 closed with the prospect that all revenues received by the federal treasury would equal not more than one-half of current government expenditures.

One major tax development in 1940 was the issuance by the treasury of \$500,000,000 fully taxable five-year notes at the low interest rate of $\frac{3}{4}$ of 1%. This action was taken as the first direct step toward removal of tax exemption from all future federal bonds, and possibly state bonds as well, the latter a highly controversial subject.

Federal, state and local tax collections in the United States for the fiscal year 1940 were estimated by the National Industrial Conference board at approximately \$14,354,000,000, of

which \$5,568,000,000 was federal, \$4,086,000,000 was state and \$4,700,000,000 was local. (See also SUPREME COURT OF THE UNITED STATES.)

Great Britain.—The end of the year 1940 found Great Britain bearing up under the most crushing tax burden in its history. Heavy increases were made during the year in the taxes imposed upon individuals and corporations. Finance Act. No. 2 of August 22 fixed the standard (normal) income tax rate for the year 1940-41 at 8s.6d., or 42½%, which rate supersedes the 7s.6d., or 37½%, rate which had been established for 1940-41 by two previous acts.

Personal allowances (exemptions) for individuals remained unchanged at £100 for a single person, £170 for a married couple and £50 for each child. The first £150 of taxable income is taxed at 5s., or 25%.

The excess profits tax rate is increased from 60% to 100%: that is, Britain confiscates all corporate earnings deemed to be in excess of "normal." Other new revenue measures include a purchase tax of 33⅓% of wholesale value on luxury goods and 24% on necessities. The maximum rate of death taxes has been boosted to 60% on the largest estates. There are numerous other new and increased consumer taxes.

Canada.—In addition to drastic modifications of income tax rates and excess profits taxes, Canada on June 1, 1940, inaugurated a national defence tax at a flat rate on total net income. The rate is 2% for married persons whose income exceeds \$2,000 a year. In the case of single persons the rate is 2% on incomes between \$600 and \$1,200, and 3% if annual income exceeds \$1,200. Employers are required to deduct this tax from employees' earnings. The new excess profits tax rate is increased from 50% to 75% on the excess over "standard" profits (average profits for 1936-39 inclusive). The individual income tax base was broadened by reducing exemptions.

Australia.—On Nov. 21, 1940, the commonwealth imposed new taxes on an unprecedented scale, the third major assessment act of the year. The range of the income tax was extended and the graduated rates sharply increased. With state taxes also heavy, Australia will devote 20% of national income to the war effort. The increased income is set to yield £26,000,000, compared to the £10,000,000 tax imposed under Act No. 18 of May 27, 1940.

Corresponding tax increases were made by New Zealand and by the Union of South Africa.

Germany.—Only minor changes were made in 1940 in German taxation. The war economic decree of Sept. 4, 1939, established a war surtax of 50% of the normal income tax on incomes in excess of 2,400 marks, but this surtax is not to exceed 15% of total income, and the income tax plus surtax is not to exceed 65% of total income. A decree issued Nov. 7, 1940, exempts from income tax all extra payments to workers for overtime and for Sunday, holiday and night work. In December, obviously to induce more Germans and German businesses to move to the former Polish territories now incorporated into the reich, nazi authorities drastically reduced the taxes payable in those districts.

U.S.S.R.—Income taxes are collected monthly by the soviet union and the graduated rates cover a wide range, depending upon the occupation or profession of the taxpayer. Exempted as to their income from work are all Heroes of Labour and citizens decorated with orders or honours, but any income from other sources in excess of 6,000 rubles a year is taxed. New taxes for housing and cultural construction also were imposed. (See also INCOME TAX; INITIATIVE AND REFERENDUM; LEGISLATION.)

(C. A. SR.)

Taylor, David Watson (1864-1940), U.S. naval officer, was born in Louisa county, Va., March 4, and was educated at Randolph-Macon college and the United States Naval academy, graduating from the latter in 1885 with the highest standing attained by any student up to that time. He was sent to the Royal Naval college in England from which he was graduated in 1888, again with the highest honours on record. He achieved the rank of captain in 1901 and was made a rear admiral in 1917. He was chief constructor of the U.S. navy and head of the bureau of construction and repair from 1914 to 1922. He retired in 1923 and died in Washington, July 28.

Tea. The world consumption of tea increased substantially in 1940 despite rationing in the United Kingdom and other wartime restrictions. For the year April 1, 1939, to March 31,

1940, the International Tea committee announced total exports of 932,100,000 lb. compared to 926,500,000 lb. in the preceding months of 1938-39, and 874,100,000 lb. in 1937-38, and 833,500,000 lb. in 1936-37. Of the 1939-40 exports, 80% was from India, Ceylon and the Netherlands East Indies, and 2½% was from British East Africa, all areas conforming to quota regulations of the International Tea committee. The remaining 17½% was from countries not subscribing to regulations, chiefly China, Formosa and Japan. Extensive advertising by the tea industry is reported to have increased tea consumption in the United States in the last six years. United States imports for the five years 1935-39 averaged 87,231,000 lb., valued at \$18,818,000, with yearly per capita consumption at 0.68 lb. Imports in the United States in the calendar year 1940 were 97,791,000 lb., valued at \$21,090,000, and per capita consumption was 0.74 lb. For the first ten months of 1940, United States imports of tea were 80,213,982 lb., valued at \$18,583,178. Of the United States' 1940 imports slightly more than 1,000,000 lb. were from the United Kingdom, where tea was rationed to 2 oz. per person per week and where restrictions reduced yearly per capita consumption from about 9½ lb. to 6½ lb. The amount of tea imports examined by the United States Food and Drug administration in the fiscal year ending June 30, 1940, was 102,662,503 lb., of which 169,345 lb. were rejected. In the preceding fiscal year 88,027,924 lb. were examined under provisions of the Federal Tea act. The table shows varieties and quantities of tea examined and passed or rejected by the United States in the fiscal year ending in 1940.

Telegraphy. The year 1940 witnessed a continuation of the gradual transition of the telegraph industry to automatic time and cost saving methods and toward increased speed and accuracy which has been noticeable in recent years.

Maximum Usage of Trunk Lines, which in recent years has been greatly advanced by use, among other means, of the varioplex, was accelerated during 1940 by a considerable expansion of varioplex usage. The number of such systems and the patrons served thereby showed a substantial increase.

Reperforator Switching, already so successfully applied to the automatic passing of business through relay telegraph offices, was being further applied and was also coming more and more into favour with large users of the telegraph who operate their own private wire systems. A number of these automatic relaying installations were in use by important institutions.

Subcentre Switching, a means by which a group of patrons, or small offices, each having a private line to a central point may be automatically connected, over a limited number of trunks, with

a main telegraph office or with distant points for the direct transmission of business in either direction, was still further developed and utilized.

Frequency Modulation, much publicized for radio broadcasting, where higher quality channels are obtained by its use, was successfully applied to carrier telegraphy, providing an important increase in reliability without reducing the total capacity or number of channels in the carrier system to which it is applied.

Facsimile Telegraphy, in its various applications, continued to advance in perfection of devices and in usage. This method of transmission is now used in the automatic telegraph, enabling a patron to deposit his telegram in a slot machine by which the message is automatically transmitted to a central telegraph office, between branch and main telegraph offices and between distant cities. The facsimile transmission of matter and its reproduction in stencil or other master copy form, permitting many reproductions at a distant point, reached higher stages of development and sending and recording machines performing these functions can now be located hundreds of miles apart. Where different sources of power are used the synchronous operation of the motors driving these machines is assured by the use of electrically driven tuning forks.

Rubber Insulators, quite often used in the early days of the telegraph, but later replaced almost entirely by glass and porcelain because of the better insulating properties of the latter materials, were improved to such a degree that they were frequently used in locations where considerable breakage was encountered. (R. B. W.)

Telepathy: see PSYCHICAL RESEARCH.

Telephone. The number of telephones in service in the United States is expected to show an increase for 1940 of more than 1,000,000 and will thereby reach a new high level. To meet the increased traffic resulting from the faster tempo of business, about 500,000 circuit miles were added in 1940, for long-haul toll service. About two-thirds of this mileage was provided by voice-frequency facilities and the older types of carrier systems, while one-third was added by means of the so-called broad band carrier system for open-wire and cable.

Toll Cable.—By the end of 1940 more than 70% of all long-haul circuits had the stability afforded by protection in impervious lead sheath. Plans completed called for the westward extension

TELEPHONES PER 100 POPULATION
OF LARGE CITIES

January 1, 1939

of the cable network from Omaha, Neb., and by the end of 1941 twin cables from Omaha to Denver, Colo., will be ready for service. Part of this line will be placed in conduit, but for most of the 600 mi. distance the cables will be buried by a special plow perfected during 1940. The plow buries both cables at once, one above the other.

Another important cable was installed between Baltimore, Md., and Washington, D.C. This runs underground along a route entirely different from that followed by all of the direct cables previously in service between the two cities. Another cable project (advanced two years ahead of schedule for reasons of national defence) is the twin-cable installation between Richmond and Norfolk, Va. Moreover, in the 112-mile section of the trans-continental line between Amarillo, Tex., and Tucumcari, N.M., snow and ice on the open-wire lines at times interrupted transmission. Two small cables arranged for carrier operation were therefore placed in this section.

Coaxial Cables.—The first commercial installation of coaxial cables between Minneapolis, Minn., and Stevens Point, Wis., a distance of about 200 mi., was completed and regularly handled traffic. During the severe storm emergency in the northwest in November, a number of the coaxial circuits were useful in replacing damaged circuits on other routes. The full capacity of the cable for 480 circuits will not be utilized for some years.

Dial Service.—The number of dial telephones in service in the Bell system increased by about 1,250,000 in 1940, so that approximately 62% of telephones were dial-operated. About 220,000 lines of crossbar dial central office equipment were installed, and some 350,000 were in 1940 served by crossbar equipment.

Further progress was also made in 1940 in applying methods whereby toll operators may dial directly the number of a tele-

phone in a distant community. For example, on a call from New York city to a town in Ohio which is connected to Columbus, O., by a dial intertoll trunk, the Columbus operator upon receiving the call can dial directly the desired number in the distant town instead of relaying the call to the local operator there. The Ohio toll dial network is at present the largest in the country, comprising some 265 dial intertoll trunks and permitting toll calls up to about 200 mi. to be dialed by the operator.

During 1940 about 14% of all toll messages were handled in this way.

Radio Telephone Services.—By the end of 1940 overseas service to Belgium, France, Gibraltar, Greece, Luxembourg and the Netherlands was suspended because of the war. Although transatlantic traffic fell off, calls to South America, Hawaii and Australia gradually increased, so that the total volume of overseas traffic was nearly as great as it was before the war. Facilities for additional circuits to South America were being built and facilities to the Caribbean countries improved.

In the matter of coastal and harbour radio telephone service, over 2,500 vessels were equipped in 1940 for communication with any land telephone. At the close of 1940 there were 14 radio telephone transmitting and receiving stations serving the waters of the Atlantic, Pacific and Gulf coasts. In addition, in 1940 there were six non-Bell stations serving the Great Lakes and other inland waterways.

The year 1939 inaugurated a service in New York city and Chicago, Ill., whereby telephone customers may obtain the latest weather information and forecasts by calling or dialing WEather 6-1212 in New York and WEather 1212 in Chicago. The reports are recorded upon endless magnetic tape and the equipment is so designed as to transmit at the proper sound level to as many customers as may be simultaneously connected to the bureau. For the tape a new magnetic alloy called "vicalloy" is used. Vicalloy can be made to hold more permanent magnetism than any commercial material. In 1940 the service was offered in Baltimore; Washington, D.C.; Detroit, Mich., and Boston, Mass.

Telescopes. Interruptions to normal scientific research occasioned by the war resulted in the planning of but very few important telescopes outside of the United States in 1940. Of those under construction the progress may be summarized as follows:

200-in. Reflecting Telescope (F 3.3) of the California Institute of Technology. Major portions of the mounting were erected and tested on Mt. Palomar and much of the driving mechanism was completed. Optical figuring of the 200-in. mirror was in progress. A small amount of residual astigmatism is now being removed and a slight bending of the disk in the vertical position is being corrected by the addition of compensating levers to the support system.

74-in. Reflecting Telescope (F 4.9) of the Radcliffe observatory. Dome and mounting were erected at Pretoria, South Africa, but completion of mirror in England was delayed by war conditions.

48-in. Schmidt Telescope (F 2.5) of the California Institute of Technology. Spherical Mirror, 72 in. in diameter, was completed and figuring of 48-in. correcting plate was in progress. Dome on Mt. Palomar was erected and mounting under construction.

24-in. Schmidt Telescope (F 2.5) of the Harvard college observatory. Optical parts consist of a 33-in. spherical mirror and a 24-in. correcting plate. Instrument was essentially completed and erected at the Oak Ridge station.

21-in. Photographic Refracting Telescope (F 7) of the Lick observatory of the University of California. Mounting was finished and erected on Mt. Hamilton and optical figuring of lens was completed.

In addition a plan was under way for converting the 60-in. reflector of the Harvard college observatory in South Africa into a telescope of the Schmidt type.

Two instruments planned for photographing the solar corona in full sunlight are the coronagraph of the Lyot type built by the Harvard college observatory to be used at a mountain site in Colorado and the scanning device developed by Skellett at the laboratories of the American Telephone com-

pany, under erection at the McDonald observatory in Texas.

The deposition of fluoride coatings upon the surfaces of lenses and prisms to reduce losses by reflection has resulted in a marked gain in the light-efficiency of all auxiliary instruments used with telescopes, being especially effective in stellar spectrographs. (See also *ASTRONOMY*.) (W. S. AD.)

Television. Technical advances in television for the year 1940, so far as they are generally known, appeared largely to have been limited to work carried on in the United States. Wartime activities in Britain and Germany, which nations formerly were also centres of television development, seemed to have put an end to television research there, although it was rumoured that the application of television to specific military requirements was at least being studied. No one can deny that television would be a strategic tool of outstanding value if it were capable of transmitting the maximum detail that is now obtainable in the photographic sciences. If a plane flying at 20,000 ft. could transmit, to the base station, a motion picture that would locate and identify machine-gun nests, or even supply centres, the result should be useful in a military sense. But it happens that television was in 1940 less exact than the highly developed "still" photograph; this same lack of ultimate detail was also characteristic of the motion picture, and it seems reasonable to conclude that until the military authorities find a utility in the ability of television to show scenes in motion, there will be little opportunity for either television or the movies to compete with the camera in a military sense.

But the situation in 1940 with respect to the home broadcasting of television was different. While all who are familiar with the field might puzzle as to just what military applications might be important, there was little or no difference of opinion as to the fact that television has merit as a home broadcast service. The addition of sight to sound, via the radio, is qualitatively comparable to the addition of sound to sight in the motion pictures of some years ago. The experimental television operations, particularly in the U.S.A., England and Germany, have proved that in certain types of program the provision of both visual and aural interpretation has immensely increased the value of the program in terms of observer interest and satisfaction.

Television in the U.S.A. appeared to have started off, early in 1940, under conditions which would have made it at least partially self-supporting by reason of the contributions of advertisers to the cost of producing television programs. A number of receiving set manufacturers were offering television receivers for sale to the public, and a number of television broadcasting stations were planning (and in some instances producing) regularly scheduled programs of entertainment and information for home reception. However, there arose a difference of views as to standards and the need for flexibility in future development, and this resulted in Federal Communications commission actions which postponed such development of the television services on a business basis until the channels theretofore assigned to television could be rearranged to accommodate the newly developed frequency modulation type of sound broadcasting and until there was obtained further evidence of a substantially unanimous industry agreement as to the way in which television should be presented to the public.

On the first of these two points the Federal Communications commission reassigned television stations using the lowest television frequencies to a channel some six megacycles higher. This necessitated a close-down for the stations concerned, in order to permit the required changes in transmitting apparatus and antennas, but the alterations were completed in time to permit resumption of limited program service during the fall months. Television was thus able to serve the public by transmitting scenes from political meetings during the presidential campaign of 1940, including a sight-and-sound presentation of Wendell Willkie from Madison Square Garden, New York city, just before election day.

As to the second point, a plan intended to provide for industry agreement on standards for television was put into effect by the formation of the National Television Systems committee, as sponsored jointly by the Federal Communications commission and the Radio Manufacturers' association. This committee brought together all interests concerned with the development of television in the U.S.A., and it was anticipated that their joint findings would be presented to the Federal Communications commission early in 1941. The desired result was to stimulate the public adoption of television as a home broadcasting service, under a set of regulations that would encourage its extension and at the same time remove the possible dangers of early obsolescence that had previously been the subject of criticism.

Aside from what might be regarded as normal improvements in transmission refinements, such as better rendition of images having high detail or definition, and advances in the ability to pick up and deliver scenes under relatively poor conditions of lighting, there were at least three more striking accomplishments demonstrated during the year 1940.

The first of these was the use of automatic relay stations for passing the television images from point to point or from town to town, which might remove the limitation of service radius that generally characterized a single television transmitter and which thus might pave the way toward the organization of television chains or networks broadly similar to those which have been so prominent in sound broadcasting.

The second was the showing of television in full colour, which represented an impressive contribution toward the realistic reproduction of views in which the colour content, rather than the general pictorial value, is important.

The third was represented by private showings of large-screen television reproduction, in which images having detail as good as the best obtainable on small screens were projected with sufficient enlargement to be visible to theatre audiences. Public demonstrations of such advances were expected during 1941, and they should be important in helping to define the future relations between television and the theatre motion picture.

(J. V. L. H.)

TELEVISION IN COLOUR was successfully demonstrated Aug. 29, 1940, by its inventor, Dr. Peter C. Goldmark (left), shown adjusting a film scanner

Tennessee, a south-central state of the American union, the 16th state to enter the union, popularly known as the "Volunteer State"; state flower, iris; state bird, mocking bird; area, 42,022 sq.mi.; population according to the U.S. census of 1940, 2,915,841; capital, Nashville, population, 167,402. The only city with larger population is Memphis with 292,942.

In the decade 1930 to 1940 Tennessee rose in rank from 16th to 15th among the states with respect to total population.

History.—Governor, Prentice Cooper; secretary of state, A. B. Broadbent; attorney general, Roy Beeler; commissioners as follows: agriculture, C. C. Flannery; conservation, J. Charles Poe; education, B. O. Duggan; finance and taxation, George McCandless; highways and public works, C. W. Phillips; institutions, A. T. Taylor; welfare, Paul Savage; insurance and banking, J. M. McCormick; labour, S. E. Bryant; public health, W. C. Williams; railways and public utilities, W. D. Hudson, Porter Dunlap and Leon Joroulman.

The election returns were as follows: president: Roosevelt (Dem.), 351,601; Willkie (Rep.), 169,153; Babson (Prohibition), 1,606; Thomas (Soc.), 463. U.S. senator: McKellar (Dem.), 295,440; Baker (Rep.), 121,790; Neal (Ind.), 35. Governor: Cooper (Dem., re-elected), 323,466; Bruce (Rep.), 125,254. Railway and public utilities commissioner: Dunlap (Dem.), 278,793; Maddox (Rep.), 103,935.

Education.—Per cent of illiteracy in 1930 for whites was 5.4, for Negroes, 14.9. Of 5,712 elementary schools 1,484 had 3 or more teachers in 1939; one-teacher elementary schools declined from 3,555 in 1927 to 2,632 in 1939. Enrolment in elementary schools was 524,881. In 1939, all but 5.7% of elementary teachers had more than high school training; 22.3% were college graduates. The state maintained in 1940 seven institutions for higher learning with an enrolment at the regular session of 10,630 students in 1938-39. The estimated valuation of these was \$15,050,001 in 1935. In addition there were separate schools for the blind, the deaf and underprivileged children; three state hospitals for the insane; a home and training school for feeble-minded; and four training or correctional schools, respectively for white boys, Negro boys, white girls and Negro girls; a commission and workshop for the blind; and two state penitentiaries.

Finance.—In 1940 there were 71 national banks with 17 branches and 226 state banks with 32 branches, with assets of \$477,891,000 for national, and \$165,573,000 for state banks. Savings and loan associations numbered 49 with assets of \$26,948,211. Insurance payments made by policyholders amounted to \$65,576,741 in 1939.

In 1939 there were 551 companies licensed to write insurance in the state.

Agriculture.—There were 273,783 farms in 1935; 1,308,420 farm population; 19,085,837 ac. in farms with 6,134,200 ac. of crop land harvested. Estimated value of crop production was \$86,577,000 in 1939. Corn 2,635,000 ac., 52,700,000 bu.; cotton, 726,000 ac., 450,000 bales; hay, 1,621,000 ac., 1,629,000 short tons; tobacco, 117,900 ac., 112,716,000 lb. Cattle on farms Jan. 1, 1940 were 1,228,000; hogs, 1,258,000; horses and mules, 458,000. Cash farm income from crops was \$58,470,000 in 1939; from livestock and livestock products, \$58,195,000; government payments to farmers were \$15,713,000; gross value of agricultural production for the state was \$167,623,000. Cash farm income was \$116,665,000 in 1939. Tuberculin testing of cattle in the state was completed in 1935. Commercial forest area in 1929 was 14,000,000 ac. The cut in 1935 was 337,008,000 board feet, total value of lumber products \$11,944,159, of which \$6,831,597 were added by manufacture.

Manufactures.—In 1937 there were 1,991 manufacturing plants yielding products valued at \$707,986,784, of which \$295,-

626,708 constituted value added by manufacture. Value of mineral production was \$34,893,847 in 1937. Tonnage of bituminous coal production in 1938 according to the Tennessee department of labour was 4,378,586 short tons; limestone, 5,111,503 short tons; phosphate rock, 1,081,798 short tons. The number of wage earners in manufacturing increased from 107,645 in 1925 to 135,073 in 1937.

Manufacturing and urbanization are making marked progress in the state.

The Great Smoky Mountain national park with 174,230 ac. in Tennessee attracted 860,960 visitors for the year ending Sept. 30, 1940.

The per capita income of the state was \$296 in 1939.

(C. E. A.)

Tennessee Valley Authority. The Tennessee Valley authority, a corporative regional agency of the United States government, created by act of congress in 1933, had, in 1940, developed a commercially useful channel in 464 mi. of the Tennessee river as far upstream as Chattanooga, Tenn., provided behind its dams 4,000,000 ac.ft. of storage capacity reserved for flood control, and attained an electrical generating capacity of 984,800 kilowatts from which electricity was being supplied to 75 municipalities and 38 electric co-operatives in the valley (which consists of portions of Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee and Virginia).

In the furtherance of TVA's five-fold mandate to develop navigation, flood control, electric power, national defence and the region's agricultural economy, congress had appropriated \$335,000,000 to Aug. 1, 1940, and had authorized TVA to issue \$70,000,000 in bonds (of which \$60,000,000 has been issued) in the largest construction and regional development programs ever directly undertaken by the U.S. government. In addition, TVA, since its inception, had utilized Wilson dam, near the southernmost tip of the Tennessee river, representing an investment of \$31,300,000.

Congress in 1940 authorized construction of Cherokee dam as part of an emergency program to increase TVA's electrical output for industrial production in the national defence. Under construction in 1940 were Cherokee, on the Holston river 35 mi. from its confluence with the Tennessee river; and, on the Tennessee river, Kentucky dam, at mile 22.3 from the mouth, Watts Bar dam, at mile 529.9, and Fort Loudoun dam, at mile 602.3. The working schedule called for completion of Cherokee and Watts Bar in 1942, Fort Loudoun in 1944, and Kentucky in 1945.

TVA dams on the Tennessee river in the order of their progression up the 650-mile waterway were as follows, with those under construction in 1940 indicated parenthetically in their sequence: (Kentucky dam, mile 22.3, in Kentucky); Pickwick Landing dam, mile 206.7, in Tennessee; Dam No. 1, mile 256.8, in Alabama; Wilson dam, mile 259.4, in Alabama; Wheeler dam, mile 274.9, in Alabama; Guntersville dam, mile 349, in Alabama; Hales Bar dam, mile 431.1, in Tennessee; Chickamauga dam, mile 471, in Tennessee; (Watts Bar dam, mile 530, in Tennessee; Fort Loudoun dam, mile 602.3, in Tennessee).

Tributary storage dams built and operated by TVA are Norris dam, in Tennessee, on the Clinch river, 79.8 mi. from the mouth, and Hiwassee, in North Carolina, on the Hiwassee river, 75.8 mi. from the mouth.

Every one of the mainstream dams creates a link in a chain of lakes providing slack-water navigation the year round. Nine-foot navigation was provided by Ohio river dam No. 52 of the United States army engineers for a distance of 22.3 mi. up the Tennessee from Paducah, Ky., to the point at which Kentucky dam was

being built. The 184.3 miles next upstream to Pickwick Landing dam had a controlling minimum depth of 6 ft. at extreme low water, but generally 7- to 7½-foot depths were maintained and the full 9-foot channel was to be completed by Kentucky dam. From Pickwick Landing the 257.4 mi. upstream to Watts Bar, 58.9 mi. beyond Chattanooga, the then head of navigation, the 9-foot channel was maintained, except for short stretches in which minimum controlling depths of 7 and 6 ft. remained to be increased to the standard navigation depth of 9 ft., principally by dredging. Controlling channel depth was to be increased to 9 ft., with 2-ft. over-depth, the entire 650 mi. between Paducah, Ky., and Knoxville, Tenn., by the dams under construction, and incidental development, including dredging, all to be completed in 1945.

The authority in 1940 was supplying to municipal and co-operative systems, for distribution to more than 405,000 customers at uniformly low retail rates, electrical energy carried over approximately 4,900 mi. of TVA transmission lines, and was supplying electricity to large industrial consumers, among them the Aluminum Company of America, the Monsanto Chemical company, the Victor Chemical works and the Electro-Metallurgical company.

In 1940, sales of electricity by the authority amounted to more than \$15,000,000 annually. The TVA basic residential rate schedule per month was in 1940: for first 50 kw.hr., 3¢ a kw.hr.; for next 150 kw.hr., 2¢ a kw.hr.; for next 200 kw.hr., 1¢ a kw.hr.; for next 1,000 kw.hr., 4 mills a kw.hr.; for all over 1,400 kw.hr., 7½ mills a kw.hr.

The installed capacity of the authority's power system in major plants reached 984,800 kw. in 1940. Normally, installations to increase total capacity to 1,207,000 kw. were to have been added by 1943. To provide an increased supply of electricity required for the national defence program, congress instructed the authority to carry out an emergency schedule to increase the generating capacity by 300,000 kw. in addition to the normal installations. Principal elements of the emergency program were Cherokee dam, which would have a generating capacity of 90,000 kw., and a steam plant of 120,000 kw. capacity in the vicinity of Watts Bar dam. The normal and emergency installations totalling 518,600 kw. were scheduled to be completed by Oct. 1942.

TVA and 73 municipalities and co-operatives acquired utility properties from privately owned companies for purchase prices totalling \$116,700,000. The authority purchased transmission lines, generating plants and several of the smaller distribution systems for \$55,500,000. The municipalities and co-operatives paid \$61,200,000 for the major distribution systems and for relatively minor water and gas properties that were associated with the electrical holdings.

The total acquired distribution properties served approximately 288,135 customers in Alabama, Georgia, Mississippi, North Carolina and Tennessee. Largest single purchase was consummated in 1939 when TVA, 22 municipalities and 11 co-operatives bought all the electric properties of the Tennessee Electric Power company, serving 142,110 customers, for \$78,600,000, of which the authority's share was \$44,949,400.

Flood control by TVA dams, estimated to effect an average annual saving of \$100,000,000 in flood damages on the Tennessee and portions of the Ohio and Mississippi rivers, was to be increased by addition to the system of Cherokee dam, whose reservoir would be of the heavy storage type, as are the Norris and Hiwassee reservoirs. Controlled storage at TVA dams was 4,000,000 ac.ft. and would be increased to 10,000,000 ac.ft. by dams under construction, principally by Cherokee and Kentucky dams.

At the Muscle Shoals munitions plant, constantly maintained in a state of readiness for defence production, highly concentrated phosphate fertilizer developed by the authority had been produced to a total of more than 290,000 tons in seven years. About 111,-

000 tons of the superphosphate had been distributed to 30,683 privately owned farms, covering 4,890,000 ac. in 22 states, where, with the co-operation of state agricultural extension services, it was used to demonstrate how an improved plant food, low in cost to the land, can aid agriculture. The authority in 1940 set about rehabilitation and enlargement of other portions of the Muscle Shoals plant to produce ammonium nitrate for use in munitions.

In 1940 TVA announced the discovery by one of its engineers, John H. Walthall, of a means for producing alumina, the raw material of aluminium, from clays which the valley contains in great abundance.

The authority's relationship with its employees, who had fluctuated in number between 11,000 and 17,000, was formalized by the execution of a contract agreement in 1940 between TVA and the Tennessee Valley Trades and Labor council, which represented 15 union labour organizations affiliated with the American Federation of Labor. This document was the first contract agreement with organized labour ever entered into by the federal government.

The authority is headed by a three-member board of directors: Dr. Harcourt A. Morgan, chairman; David E. Lilienthal, vice-chairman; and James P. Pope. The board's policies are executed by a general manager, Gordon R. Clapp. (See also ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.) (W. L. S.)

Tennis. The season of 1940 was largely concentrated in the United States, the only major tennis-playing nation which was not engaged in war. With the exception of a few sporadic meetings held in late winter and early spring in Italy and Germany, no tournaments were held on the continent during the year. All matches in England were abandoned and the All England Club building at Wimbledon was turned into a first aid post

DON McNEILL of Oklahoma City dethroned Bobby Riggs as U.S. national tennis champion Sept. 9, 1940, at the Forest Hills, L.I., tournament

for that borough. Naturally, the matches for the Davis cup were not held, the trophy itself remaining in the hands of Australia, the tennis champion nation.

Save for the United States, Australia was the only important country to hold a national tennis championship during 1940. England did not hold any; France did not hold any; Japan, Germany and Italy did not hold any. The Australian championships took place at Sydney, N.S.W., in January. This tournament was remarkable for the fine play of Jack Crawford, the veteran Davis cup player, who defeated John E. Bromwich, the champion, in the semifinal round. Crawford, however, was no match for Adrian Quist who won the finals in three sets. Quist, who won his first singles title in 1936, captured the doubles title with Bromwich and became doubles champion for the fifth time in succession.

During the remainder of the year pretty much the only first class play was on the American continent. Two players stood out in the United States: Robert L. Riggs the champion and Don McNeill the third ranking star. They had a series of struggles starting at the indoor championships in New York in March when Riggs deprived McNeill of his title by beating him in five sets in the finals. McNeill turned the tables in June, conquering Riggs on dirt and winning the clay court championships at River Forest, Illinois. Riggs retaliated in the finals of the eastern grass court championships at Rye, New York, in August, defeating McNeill in the finals in four sets.

With no noteworthy foreign representation, the 59th National Singles Championships held as usual early in September at the West Side Tennis club, Forest Hills, L.I., was interesting chiefly because of the rivalry between these two players. Neither was seriously threatened on the way to the finals. There Riggs worked quickly into a lead of two sets to none and apparently had the match well in hand. He became careless and McNeill fought to victory by taking the net at every chance throughout the last three sets.

Alice Marble of California dominated the woman's field even more than in 1939. There was no one in her class and no player of her sex able to extend her. She lost only half a dozen sets all summer, won the doubles championships of the United States with Mrs. Sarah Palfrey Fabyan and the mixed title with Riggs. Her closest rivals of former years, Mrs. Fabyan and Miss Helen H. Jacobs, especially the latter, both fell away. When they met, Miss Marble smothered Miss Jacobs, in one finals, defeating her with the loss of only a single game in two sets, and in the National Championships beating her easily in the last match. In this tournament Miss Marble played five straight matches without losing more than three games in any one set. (J. R. Tu.)

Tetrazzini, Luisa

(1871-1940), Italian coloratura soprano, was born in Florence, June 29. She studied at the Liceo Musicale at Florence. Her first appearance was in 1895 at the Teatro Pagliani, now the Teatro Verdi. She then sang in the Argentina theatre in Rome and not long after made a tour of South America, singing in Buenos Aires, Rosario, Montevideo and Rio de Janeiro. She then filled engagements in Lisbon and Madrid and sang for seven successive seasons in Russia, after which she returned to Italy to sing with Tamagno and Caruso. In 1904 she sang in Mexico and then made her first appearance in the United States at San Francisco. In 1908 she made her debut in New York city under the management of Oscar Hammerstein. For two seasons she appeared with the Metropolitan Opera company of New York; she also sang with the Chicago Opera association in 1913 and 1914. She sang in concert in the United States and Canada in 1921 and made her last appearance in the United States in 1932. Her favourite opera was *Lucia di Lammermoor*. She died in Milan, April 28.

Texas, south-central state of the United States, first a colonial possession of Spain and later a part of Mexico, became an independent republic in 1836 and was admitted to the United States in Dec. 1845. It is sometimes called the "Lone Star State," because of the state flag with a single star. Area, 265,896 sq.mi. (largest in the union); population (U.S. census, 1940), 6,414,824. Capital, Austin, pop. (U.S. census, 1940), 87,930. The three largest cities, according to the 1940 census are Houston, 384,514; Dallas, 294,734; and San Antonio, 253,854. According to the 1940 census about 45% of the population is urban. According to the 1930 census about 72% is white, about 16% is Negro and about 12% is distributed among other races (the Mexicans, living mostly in the southwestern part of the state, comprise nearly all of this last group). Although the 1940 figures were not available, it is not likely that these percentages have changed much.

History.—In the presidential election the Democratic candidates carried Texas by an overwhelming majority. The vote for presidential electors was as follows: Democrat, 840,151; Republican, 199,152; Socialist, 728; Communist, 212; Prohibition, 925.

W. Lee O'Daniel, elected governor in 1938 on a platform favouring \$30 per month for all persons over 65 years of age, was re-elected in 1940. The opposition to him in the political campaign was bitter but ineffectual. The legislature did not meet during the year because the governor refused to call a special session.

Other leading state officials who were re-elected were Coke R. Stevenson, lieutenant governor; Gerald Mann, attorney-general; Charlie Lockhart, treasurer; Bascom Giles, commissioner of general land office; J. A. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller. The railroad commission will be composed of Ernest O. Thompson, Jerry Sadler and Olin Culberson (newly elected).

During the year, Texas, like most of the nation, turned its attention to the problem of national defence. Work was begun on a great army encampment at Brownwood. At Corpus Christi construction started on a huge air-naval base. The shipyards at Orange received orders to build 12 destroyers. Altogether, between the months of July and November of 1940 the national defence appropriation allotted to Texas was \$165,478,000.

Education.—The state maintains a general system of public schools, extending from the primary grades to colleges and the University of Texas.

In 1940 the scholastic population, from six to 17 years inclusive, was 1,549,654, of whom 244,024 were Negroes. The schools below college rank are supported by both local taxes and state funds.

The latter, apportioned at \$22.50 per pupil, totalled \$34,866,215. Fully accredited four-year high schools numbered 1,309. The state also supports 16 institutions of higher learning, including one for Negroes, and 78 public junior colleges. There are more than 20 denominational and privately endowed colleges.

Charities and Correction.—The state maintains 22 eleemosynary institutions. Half of these are hospitals for mental and nervous cases; a new one was completed at Big Springs in 1939, but accommodations for such cases were still inadequate. There are also two sanatoriums for tuberculosis victims; schools for the blind and for the deaf (white and Negro); two homes for delinquent children; two for white orphans and one for Negro; one for defectives; one for crippled children. There is a home for Confederate veterans and one for the widows of veterans. A number of homes for orphans and for crippled children are supported by private means, religious sects and fraternal orders. The state prison system is extensive; the principal unit is the penitentiary at Huntsville.

Banking and Finance.—The 446 national banks in Texas, according to the report of June 29, 1940, showed a total capital stock of \$72,881,000, plus surplus, profits and reserves of \$82,760,000; deposits, \$1,405,510,000; loans, \$429,607,000; cash reserves, including balances with other banks, \$714,796,000; total resources, \$1,566,211,000. The 393 state banks, according to the report of June 29, 1940, showed a capital stock of \$16,938,000; deposits, \$194,202,115; loans and discounts, \$88,360,360; total resources, \$236,806,794. The state treasury, for the fiscal year ending Aug. 31, 1940, reported total taxes and licences received, \$121,524,457; total revenue receipts, \$187,409,854. At the end of 1940 a cash balance of \$16,000,000 was announced, despite a bonded indebtedness of \$12,990,450, and deficits in the general revenue fund and the Confederate pension fund of \$23,296,519 and \$1,987,405, respectively.

Agriculture, Minerals and Manufactures.—The drought that had damaged crops during 1939 was broken in 1940. Cotton prices stayed about the same, although cotton was put on the market later than in dry years. Cattle prices were 40% higher than in 1939; hogs, 25% higher; sheep were 40% lower; and the total farm cash income was \$450,000,000 as compared to \$314,765,000 in 1939.

The value of the following crops, according to figures and estimates furnished by the bureau of business research of the University of Texas, showed an increase: The cotton crop of 3,479,000 bales brought \$132,800,000 in 1940 as compared with \$123,647,000 in 1939; cottonseed (1,113,000 tons) brought \$20,814,000 as compared with \$17,859,000 in 1939. The corn crop of 14,116,000 bu. brought \$5,720,000 or almost \$2,000,000 more than the 1939 crop. Wheat, yielding 24,700,000 bu., brought \$16,573,000 as compared with \$15,089,000 in 1939. Grain sorghum, with a crop of 13,461,000 bu., brought \$5,931,000, or over \$1,000,000 more than the 1939 crop. These figures, as well as those to follow for livestock production, are based on cash income and do not take into consideration produce consumed on farm and ranch but not sold. In 1940 cattle and calves yielded an income of \$81,856,000—almost \$12,000,000 less than the 1939 income. Hogs brought less also, \$99,643,000, as compared with \$111,900,000 in 1939. Sheep brought \$11,497,000, or over \$1,000,000 more than in 1939. In addition, an income of about \$32,000,000 for milk and about \$6,000,000 for poultry, eggs and turkeys raised the total cash income. Wool and mohair clip, representing an important industry, made considerable gains over 1939, wool clip yielding 84,000,000 lb., valued at \$23,132,000 as against \$17,899,000 in 1939, and mohair clip yielding 15,345,000 lb., valued at \$9,584,000, as against \$6,779,000 in 1939.

The value of the sulphur produced in 1940 was estimated at \$37,000,000; the value of the gas produced, at \$25,000,000.

The petroleum reserves of Texas were estimated at about 10,000,000,000 bbl., or about 50% of U.S. reserves. According to the latest figures furnished by the bureau of business research at the University of Texas, the state produced about 43% of the U.S. petroleum yield during 1940, or about 558,320,000 bbl. The Texas Railroad commission curtails the production of oil by means of proration and the shut-down. Consequently the potential output is almost 20 times the actual output. The year's production of oil was valued at approximately \$558,320,000.

(C. W. RA.)

Texas, University of. Fifty-eighth annual session opened Sept. 21, 1940. Main library holdings climbed to the 639,732-volume mark, ranking the collection first in the south, 13th in the nation. During the 1939-40 college year, the university was host to about a score of state-wide conferences, on such topics as the state and public education, war

and the western hemisphere, radio in education, banking, folklore, personnel problems, soil mechanics, traffic engineering, air conditioning and adult education. On June 20, 1940, Dr. R. L. Sutherland was named director of the university's \$2,500,000 Hogg lecture foundation, which also has a division for mental health. On June 22, Charles T. McCormick was named dean of the school of law. During the year university faculty and staff members published 500 items, including 30 books. Construction was started in the fall of 1940 on three new buildings—music, petroleum and chemical engineering—to bring the college's total to 49. For the 1940-41 session 23 new teaching posts were created. Enrolment for the fall semester to Oct. 28, 1940, totalled 10,320, an all-time high, at the main university. An additional 397 were enrolled in the school of medicine at Galveston and 169 in the college of nursing there. (H. P. R.)

Textile Industry.

For the second consecutive year, events in Europe in 1940 transformed a routine textile market into one of feverish activity. Just as the outbreak of the European war in the fall of 1939 created boom conditions in domestic textiles, so did the U.S. national defence program in the spring of 1940. However, the main difference between the two movements was that the defence effect was far the more lasting of the two, and in fact promised to be one of the major impulses in the industry for some time to come.

In dollars and cents, approximately \$400,000,000 was spent or committed by the quartermaster of the United States army for clothing and equipage during the brief period from June 30 to Dec. 1. This represented the major part of the buying in this field for the army authorized by the 76th congress for the fiscal year ending June 30, 1941. However, the recognition of the increasing gravity of the international situation, as presented in the president's message to the 77th congress, meant the inevitable addition of sizeable appropriations for expenditure before the end of the fiscal year in 1941 and also foreshadowed continued active government purchasing during the following fiscal year.

The net result of this and other influences was a record high for textile mill activity, the second consecutive year in which a record was set. *Textile World's* index of mill activity for 1940 was 142 (on the basis of 1923-25 as 100). This new high represented an increase of 8% over the index of 132 for 1939, the previous record year. It can be compared with 115 for 1929, and with 125 for 1937, the third highest year in the last decade.

Fashion Shift.—Another spectacular effect of war in Europe upon textiles in the United States was the shift of the responsibility for fashion leadership from Paris to New York. Various agencies involved in or concerned with the fashion cycle hastened to accept this challenge and the result was a completely new attitude toward the role which this country must play in the future. Specific contributions were the fashion shows staged by retail groups and by a co-operative movement in New York city.

Synthetic Fibres.—What was merely a potential factor in 1939 became an actuality in 1940. May 15 of the latter year was "nylon day" and one of the most remarkable retail stampedes developed when women's hosiery, made of this new synthetic, first appeared in the stores. From a quantity standpoint, however, the production of nylon hosiery was limited in 1940, due to the limitation in the output of the yarn itself. By November, for example, shipments of women's full-fashioned nylon hosiery amounted to 9.7% of the women's full-fashioned total for that month. However, this percentage increased each month and there was every reason to expect the gradual usurpation by nylon of a large part of silk's outlet in the women's hosiery field.

Since this is the last major stronghold of silk, it represents a very serious challenge to that fibre. Of course, the exigencies of

the defence program might delay this development, since nylon was being used in 1940 as an experimental substitute for silk in parachute cloth, and continued call for that fabric might decrease the supply of nylon available for hosiery use. Another important new synthetic, vinyon, found its first use in filter cloth but at the beginning of the year it was already getting into the apparel field, its introduction being in the form of a material for women's gloves.

Textile Processes and Machinery.—The major trend in textile technique was toward greater efficiency of operation and toward more completely automatic machinery and the elimination of intermediary processes. Typical developments in this direction included: continued rapid replacement of mule spinning of woollen yarns by ring spinning; extension of headless package twisting to the silk and rayon throwing field, with resulting elimination of certain operations; and perfection of high-speed printing machines.

Also of interest in the realm of technological advance were the manufacture, for the first time, of warp knitting machines in the U.S.A.; and the development of a process for electrocoating of textiles, both for decorative purposes and for the complete manufacture of pile fabrics. The latter was another portent of the potentiality of radical machinery changes in the years to come, involving even the possibility of complete replacement of some of the standard forms of equipment used. (See also COTTON; RAYON; WOOL.) (D. G. Wo.)

Thailand: see SIAM.

Thayer, Ernest Lawrence (1863–1940), U.S. journalist, was born in Lawrence, Mass., Aug. 14, and was graduated from Harvard university in 1885. In 1887 he was employed on the staff of the *San Francisco Examiner* and in June 1888 his poem "Casey at the Bat," made famous by DeWolf Hopper, appeared in that paper. He died in Santa Barbara, Calif., Aug. 21.

Theatre. The more noteworthy events in connection with the theatre in the U.S. in 1940 were six in number:

1. The award of both the New York Drama Critics' Circle plaque and the Pulitzer prize to William Saroyan's *The Time of Your Life* as the best play of the 1939–40 season. This was the first time since the inauguration of the critics' award that the Pulitzer committee followed the critics' choice.
2. The continued run of *Tobacco Road* into its eighth year, establishing an all-time record in the U.S. theatre.
3. The increased prosperity of the road theatre, notably in the later months of the year.
4. The production of numerous musical shows in the later months in the apparently sound managerial belief that this species of entertainment is particularly acceptable in times of world and national stress. Among the more successful exhibits in this period were *Boys and Girls Together*, *Cabin in the Sky*, *Panama Hattie* and *Hold On to Your Hats*, all money-makers.
5. The sincere effort of many of the New York managers to prevent wildcat ticket speculation, with the achievement of some at least fairly promising results.
6. The increase in the number of summer theatres, but the failure of the great majority of them to prosper. The summer theatre season also witnessed an increase in travelling units headed by star actors and actresses.

Other points of interest were, first, the box-office success of the Playwrights' company's production of Robert Sherwood's admonitory drama dealing with the invasion of Finland, *There Shall Be No Night*, with the Lunts in the leading roles,

NYLON YARN being wound on bobbins. Hosiery of this product was placed on general sale in the United States May 15, 1940

and the company's failure with Maxwell Anderson's deficient play about Jesus at the age of 12, *Journey to Jerusalem*, which played to no business and collapsed after just 17 performances. Secondly, the refusal of the Critics' Circle to give its annual honourable citation to a play of foreign authorship on the ground that none produced during the season was worthy of consideration. Thirdly, the news that Eugene O'Neill had not only completed five of the plays in his heroic cycle of nine, dealing with a family in America from the late 1700s to the early 1930s and called in its entirety *A Tale of Possessors Self-Dispossessed*, but had finished two full-length plays apart from the cycle named, respectively, *The Iceman Cometh* and *Long Day's Journey into Night*. O'Neill will not permit production of any plays in the cycle until the whole work is complete and disinclination to undergo the strain of rehearsals also caused him to defer production of the two separate plays until a later date. Fourthly, the continued national box-office success of the comedies, *Life with Father*, played by three different companies, and *The Man Who Came to Dinner*, similarly played by three. The reception of both throughout the country echoed their popularity in New York. And fifthly, the combination of Helen Hayes and Maurice Evans in a successful revival of Shakespeare's *Twelfth Night*.

The most amusing popular comedy, aside from the already mentioned *Life with Father* and *The Man Who Came to Dinner*, was the Thurber-Nugent *The Male Animal*. Among the biggest 1940 musical show successes, in addition to those noted for the latter part of the year, were Cole Porter's *Du Barry Was a Lady* and Irving Berlin's *Louisiana Purchase*. The year, incidentally, was a heyday for musical show comedians. Not only did Al Jolson and Ed Wynn rush back to the stage after long absences, but Bert Lahr, Victor Moore, Joe Cook, Bobby Clark and various others of the clan added themselves to the theatre's gaiety.

An organization called the Negro Playwrights' company attempted to launch itself with a play about the despair of the Negro in a white man's world—it was named *Big White Fog* and was by Theodore Ward—but made a poor start. The mad shambles called *Hellzapoppin* continued in the third year of its run to fill the Winter Garden. The commonly successful collaborative team of Kaufman and Hart disappointed their admirers with a feeble comedy, *George Washington Slept Here*. William Saroyan gave further evidence of his fecundity by producing a ballet, *The Great American Goof*, which was pretty bad, a delightful comedy,

Left: ERNEST HEMINGWAY'S *The Fifth Column*, which popularized a Spanish Civil War general's phrase and gave it to the English language, opened on Broadway March 6, 1940, starring Franchot Tone

Below: THE FIRST THEATRICAL "HIT" of 1940 on Broadway was James Thurber's comic *The Male Animal*, written with Elliott Nugent. The play brought to life Thurber's famous series of cartoons on the war between the sexes

Below, left: THE FIRST PLAY ABOUT THE EUROPEAN WAR, *There Shall Be No Night*, by Robert Sherwood, opened at New York city in May 1940. Alfred Lunt and Lynn Fontanne played the lead parts in the drama of a Finnish family during the Russian invasion

Below, right: EDNA FERBER acted in her own play, *The Royal Family*, in 1940 during the summer season at the Maplewood, N.J., theatre

Love's Old Sweet Song, and three additional plays, *Sweeney In the Trees*, *The Hero of the World*, and *Something About a Soldier*, tried out in the summer theatres. Only the first named of the three, however, seemed to have even modest possibilities for the New York stage. Saroyan also completed still another play, *Across the Board on Tomorrow Morning*, but it was still unproduced by the end of 1940.

The European situation brought a large influx of German, Austrian and French playwrights, actors, composers and directors, but nothing that any of them offered during the year proved to be of any material value to the local theatre. Successful revivals aside from *Twelfth Night* were Sean O'Casey's *Juno and the Paycock*, *Charley's Aunt*, that venerable ancient, and the melodrama, *Kind Lady*. George Bernard Shaw's *Geneva* was a dismal failure, thus continuing the Shavian falling-off with American audiences, at least so far as his later plays are concerned. Among other better-known playwrights who failed to make the critical grade were the before noted Maxwell Anderson, Sidney Kingsley, J. B. Priestley, Paul Vincent Carroll, Elmer Rice, Clifford Odets and John Van Druten. Various writers who tried their dramatic wings for the first time and found they were still too inexperienced to fly were Ernest Hemingway in *The Fifth Column*; Dorothy Thompson in *Another Sun* and Vincent Sheean in *An International Incident*.

Box-office failures that deserved a better fate were the earlier mentioned Saroyan's *Love's Old Sweet Song* and Paul Osborn's *Morning's at Seven*. Box-office failure that emphatically did not: the Laurence Olivier-Vivien Leigh revival of *Romeo and Juliet*.

In the concluding months of the year, no less than four plays dealing with Hollywood were exhibited in rapid succession on the metropolitan stage, to the particular amusement of nobody. As for the principal producing units, the Theatre Guild, after a protracted bleak period, at last managed a much better season through the device of allying itself with proficient outside producers; the Group theatre produced three plays, which got nowhere; and the Mercury theatre failed to make any appearance at all.

(G. J. N.)

Statistics.—*Tobacco Road*, at the time of its seventh birthday on Broadway Dec. 4, 1940, had set several amazing records and had outdistanced the *Abie's Irish Rose* record of 2,327 consecutive performances. Following are some of the statistics concerning the play at the beginning of its eighth year in New York city: Number of performances, 2,972; number of states toured, 42; gross income in New York city, \$1,820,000; gross income on tour, \$2,482,000; total net income, \$1,800,000.

Of the original members of the cast in New York city only Edwin Walter, who played the part of the banker, remained with the play on the completion of its seventh year. He had appeared in 2,930 performances. Five Jeeters had been in the New York cast, with the following number of performances: Henry Hull, 233; James Barton, 1,899; James Bell, 305; Eddie Garr, 120; and Will Geer, 415.

Statistics of the Theatre in New York City, 1940

Productions	116
Musical comedies	29
Plays	87
Premieres	75
Successful productions	22
Performers employed	1,659
Tickets sold	6,948,000
Approximate cost of productions	\$2,000,000
Estimated number of shows booked for other cities	103

(X.)

Great Britain.—The British theatre during 1940 was restricted in scope and temper by the war. During the winter of 1939–40, while there was little or no bombing of open towns, the industry of entertainment was briskly employed and musical shows

abounded and prospered. Some were small and clever, others were large and obvious in their appeal. Whichever had merit of its kind was sure to prosper as a source of refreshment for troops on leave. The most successful revue authors of the period in London were Herbert Farjeon, Robert Barbour and Eric Maschwitz.

Serious drama was scarce. Emlyn Williams was the only dramatist to come forward with a new and successful work of ambition, *The Light of Heart*, a capably poignant study of the rise from decline and subsequent fall of a great actor whose weakness lay in alcohol. In normal times this effectively theatrical piece might not have been so much acclaimed, but, as a somewhat lonely example of the "straight" play, performed by a first-rate cast, it became, for a while, a great success.

So did Miss Aimée Stuart's *Jeannie*, a neat little piece about a Scottish Cinderella with a Yorkshire commercial traveller as her Prince Charming. This introduced a remarkable new actress, Miss Barbara Mullen; although the part was a Scottish one and most convincingly played, Miss Mullen is an Irish girl from the Isle of Aran; she immediately captured London with her first appearance in a leading role.

But the run of both these pieces was cut short by the flare-up of the war in the summer, and in September the aerial attack on London closed the theatres almost entirely, only a few matinees being given. During the spring an attempt had been made to restore the "Old Vic" to its normal activities by John Gielgud, who appeared there at the head of star casts in the title role of *King Lear* and as Prospero in *The Tempest*; unfortunately the war bore very hardly on the second half of the short season.

An American play which was experimentally produced so caught the public fancy that, even in this desperate summer, it was transferred to a central playhouse. This was *Thunder Rock* by Charles Ardrey, its special point of appeal being its call for general participation in the world-battle for justice. The play had imagination and used the stage with a fresh command of fantasy as well as with a summons to exchange escapism for a sense of responsibility and the practical service which that involves.

There could be no visits of foreign companies to London; but the British council did send the Vic Wells ballet company on a tour of Holland, from which country it escaped with only a moment to spare.

Once home, it performed again at Sadler's Wells, where opera and ballet proved exceptionally popular even at the most difficult time. There was a short, but popular, season of Shakespeare at the Open Air theatre in Regent's park; restriction on lighting limited this to matinees.

During the year a council for the encouragement of music and the arts was formed with government support and this determined, among its many functions, to take the best kind of theatre and music to the industrial areas. Hence there were special tours with Shakespeare and Goldsmith in Lancashire and South Wales, while the Sadler's Wells opera company, when London became an impossible site for evening performances, went to the north with *Figaro* and *La Traviata*. It was an extremely difficult time for the repertory theatres, and naturally no new playwright had the chance to emerge, but several players either made or confirmed their positions on the British stage, notably Miss Barbara Mullen and, among the younger men, Michael Redgrave and Stephen Murray.

Third Term: see DEMOCRATIC PARTY; ELECTIONS.

Thomson, Sir Joseph John (1856–1940), British physicist, was born in Man-

chester, Dec. 18, and died at Trinity college, Cambridge, Aug. 30. For a biographical sketch see *Encyclopædia Britannica*, vol. 22, p. 152.

Tibet, a country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. The area is about 450,000 sq.mi.; estimates of the population vary from 750,000 to 6,000,000; 2,000,000 is probably near the truth. The religion is Lamaism, a late form of Buddhism modified by animism and primitive magic, and education is in the control of the many monasteries.

The six-year-old boy Lhamo Dhondup, discovered in 1939 after a search lasting some years and officially recognized as the 14th dalai lama, was enthroned in the Potala at Lhasa amid scenes of splendour and pageantry in Feb. 1940. Previously renamed Lingerh Lamutanchu, he received the honorific titles Jampel Ngawang Lobsang Yishey Teuzing Gyasto, meaning "tender glory, mighty in speech, excellent intellect, absolute wisdom, holding the doctrine, ocean-wide." The British and Indian governments alone sent missions, B. J. Gould, political officer for Sikkim representing both and, on behalf of the former, presenting the young potentate with a variety of costly gifts, and some suited to his age, as a mechanical singing-bird and a musical box. These gifts were reciprocated, for on returning to India in September Mr. Gould took with him five cases of presents for the viceroy besides 300 lbs. of special wool to be made into socks for war-workers in the North sea.

The dalai lama and his cabinet received the approval of the Chinese national government at Chungking, and diplomatic interchange between the countries was resumed. Internal peace would seem to be more assured, unless the modernizing tendencies of the nationalists are pushed too fast and far; but much depends on the issue of the Chinese-Japanese war (*q.v.*) and the final settlement in the far east.

BIBLIOGRAPHY.—Theos Bernard, *The Land of the Thousand Buddhas* (1940).

Timber: see LUMBER.

Tin. In 1939 world tin production increased 23% over 1938, and to 5% below the high point of 1929, to 183,900 long tons. All of the major producing countries showed material increases; of the intermediate producers, with outputs of 1,000–10,000 tons, Burma and Portugal likewise shared in the increase, but Indo-China, Great Britain, Japan and Australia showed small decreases. Production to the end of Oct. 1940 totalled 193,500 tons, indicating a new record high for the year. The accompanying table gives the details of output for the leading producers, accounting for about 90% of the current total.

World Production of Tin
(Long tons)

	1929	1933	1937	1938	1939
Belgian Congo . .	1,000	2,200	8,900	7,300	9,700
Bolivia	43,300	14,700	25,100	25,400	27,200
China	6,800	9,500	10,500	11,200	10,900
Dutch E. Indies . .	35,200	12,600	39,800	21,000	31,400
Malaya	69,400	24,900	77,500	43,200	56,000
Nigeria	10,700	3,800	10,500	7,300	10,900
Siam	10,500	10,300	16,500	13,500	17,000
World total . . .	193,000	91,000	209,100	149,700	183,900

British empire production of tin covers nearly one-half of the world total, but in Great Britain itself the output is only about 2,000 tons annually; aside from the main sources in Malaya and Nigeria, other British territory in Africa produces about 1,600 tons, Australia 3,300 tons, and Burma 5,000 tons.

Although the United States has no appreciable tin output, the country is the world's largest consumer, having during the past 25 years imported amounts averaging 46% of the world output, and in addition has supplemented these imports with secondary tin recovered from previous use, to the extent of 35% of the amount of new metal used. In 1939, imports rose from the 1938 figures but were still short of the record level of 88,000 tons in 1937, the total being 70,100 tons, increasing to 100,000 tons for the first ten months of 1940, under the pressure of the emergency stocking program.

During 1940 the production quotas were: first quarter 120%; second quarter 80%; third and fourth quarters 130%, which carries over for the first half of 1941.

A committee was appointed by the defence commission to study plans and proposals, and make recommendations for the construction of a domestic tin smelter to produce 18,000 tons of tin annually, to be built and operated by the Metals Reserve Co., an agency of the Reserve Finance corporation, and later it was announced that a five-year contract had been made with Bolivian producers to furnish the ore supply. (See also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Titanium. Both ilmenite and rutile are utilized as sources of titanium, although the former furnished most of the supply; rutile is probably mined not to exceed 1,000 tons a year, while the figure for ilmenite has grown to something like 275,000 tons. India produced 252,200 long tons of ilmenite in 1938 and exported 225,600 tons; amounts up to 9,000 tons were produced by Norway, Senegal, Canada, Portugal, Brazil and Egypt. Although some titanium is used as an alloying agent in steel, the great expansion in demand that has come during the past few years resulted from the development of titanium pigments for paint and ceramic work. Imports of titanium ores into the United States in 1939 totalled 287,600 short tons, as compared with 43,300 tons in 1933. (G. A. Ro.)

Tobacco. War and weather sharply reduced tobacco acreage and production in the United States and Canada in 1940, while in Europe, Asia and Australia there was a marked trend to increased acreage, especially of cigarette tobacco, to lessen imports from America. Further restricting the U.S. market abroad, manufacturers of cigarettes and smoking tobaccos in the United Kingdom were required to mix 4% of Greek and Turkish tobaccos in all products in 1940. This is to be increased to 8% in 1941 and manufacturers will be limited to 90% of the quantity of leaf they used in the year ended March 31, 1940. Cigarette advertisers in the United Kingdom were instructed to delete the long-familiar "pure Virginia tobacco." In the United States, 1940 crops of all types of tobacco totalled 1,376,471,000 lb., the agricultural department estimated in December, compared with the all-time record production of 1,858,364,000 lb. in 1939, and a ten-year (1929–38) average of 1,360,661,000 lb. Flue-cured (cigarette type) production in 1940 was estimated at 733,903,000 lb. or about 53% of the record flue-cured crop of 1,159,320,000 lb. in 1939. Acreage was reduced because of poor export markets and to comply with AAA regulations. The acre yield, 980 lb., exceeded the 900 lb. yield of flue-cured in 1939 and was the highest on record. The fire-cured crop was estimated at 99,370,000 lb., an increase over 95,539,000 lb. in 1939. Total production of burley tobacco was 327,708,000 lb. in 1940 and 394,798,000 lb. in 1939. In Canada, with the flue-cured acreage 30% under 1939, frost on Aug. 23 further reduced production and on Sept. 26 destroyed all unharvested leaf, leaving a crop of flue-cured estimated at 24,500,000 lb. compared with 79,700,000 lb. (revised estimate) in 1939. The total Canadian crop of all types was esti-

mated at half that of 1939 which was 109,800,000 lb. Canada, however, had an unusually large carry-over, 118,000,000 lb. as of June 30, 1940 (86,100,000 lb. in 1939 and 67,800,000 lb. in 1938).

A tobacco "holiday" in 1941 was proposed by Cuban growers in the Vuelta Abajo region, which produces about 40% of the Cuban crop. Reasons for the proposal to suspend planting were large accumulations of tobacco stocks, reduced exports and difficulties in making collections from Spain. Growers of lower grades of Cuban tobaccos, which find readier export market, did not favour the "holiday." China in 1940 added its seventh increase in cigarette taxes since 1928. In addition, flue-cured acreage was increased from 110,000 to 132,000 ac. and the 1940 crop was reported as 112,000,000 lb., a decrease because of floods from the 120,000,000 lb. in 1939. Japan increased flue-cured acreage from 71,802 in 1939 to 85,080 ac. in 1940, with a 1940 crop of 124,042,000 lb., compared with 117,125,000 lb. in 1939. The 1940 flue-cured crop in Manchuria was estimated at 53,000,000 lb. from 45,000 ac.,

U.S. Tobacco Production (All Types) by States, 1940 and 1939

	1940 lb.	1939 lb.		1940 lb.	1939 lb.
North Carolina	506,820,000	811,675,000	Connecticut	22,996,000	25,116,000
Kentucky	295,890,000	342,975,000	Florida	16,123,000	23,760,000
Tennessee	103,390,000	110,267,000	Indiana	10,222,000	11,868,000
Virginia	97,540,000	143,847,000	Massachusetts	9,281,000	9,809,000
South Carolina	81,590,000	133,200,000	Missouri	6,300,000	6,290,000
Georgia	76,420,000	95,896,000	West Virginia	2,790,000	2,736,000
Pennsylvania	48,324,000	42,459,000	New York	2,080,000	2,025,000
Wisconsin	36,532,000	31,406,000	Minnesota	920,000	840,000
Maryland	31,920,000	32,800,000	Kansas	488,000	510,000
Ohio	26,430,000	30,295,000	Alabama	415,000	410,000

compared with 39,000,000 lb. from 35,000 ac. in 1939. Australian growers announced a program to double the flue-cured acreage of 7,500 ac. owing to restrictions on imports from non-sterling countries. Thailand's flue-cured acreage in 1940 was about 4,000 ac., double that of 1939. Spain increased the 1940 tobacco area to 33,157 ac., compared with an average of 10,392 before the Spanish civil war. Significantly, 88 ac. were set aside for experimenting with growing flue-cured tobacco. In Poland the flue-cured acreage in 1940 was 4,400 compared with 2,200 ac. in 1939 and Germany was reported to be planning further increase in cigarette tobacco production in Poland. (S. O. R.)

Tobago: see WEST INDIES, BRITISH.

Todt, Fritz (1891—), German engineer, was born Sept. 4 at Pforzheim and was educated at Munich and Karlsruhe universities. During the World War of 1914-18 he was an officer in the air force. From 1928 to 1933 he was chief engineer in the department of roads, and in 1933 became inspector general of roads. He designed and directed construction for the network of highways in Germany that have served as one of the nation's greatest military assets. He was also chief engineer for construction of the West wall, Germany's equivalent of the Maginot line along the western border. The great speed with which Germany conducted its blitzkrieg drives is attributed in large measure to the system of communications and supplies organized by Todt, who was appointed minister of munitions March 20, 1940 by Hitler. On July 19, 1940 he was extolled by Hitler, speaking before the reichstag, for his part in the military successes of the reich.

Togoland: see MANDATES.

Tokugawa, Prince Iyesato (1863-1940), Japanese statesman, was born July 11. At the age of 14 he went to England, where he studied for five years. Upon his return to Japan he was appointed chamberlain

in the imperial court. When the national diet was set up he entered the house of peers, of which he became president in 1903. He was a delegate to the Conference on Limitation of Armaments at Washington, D.C., in 1921 and visited the United States several times in later years, the last time in 1934 when, at a dinner of the Japan society in New York city, he said that Japan desired settlement of all disputes with both the U.S.A. and Russia. He died in Tokyo, June 4.

Tokyo, capital of Japan, population (1940) 7,001,460; area 257 sq.mi., situated at 35° 41' N. and 139° 45' E. at the head of the bay of the same name on the southeast coast of Honshu, the main island of Japan. Tokyo is at once the administrative centre of the Japanese empire, an important industrial and commercial city and an outstanding educational centre. According to the last educational census there were 22 universities in Tokyo, with 46,625 students and 72 professional schools, with 52,165 students. The Japanese capital presents an interesting contrast between old and new Japan, with the modern office buildings in the central section of the city and the many narrow little streets with their innumerable small shops which one finds in the outlying sections. The city has entirely recovered from the tremendous earthquake of 1923 and has been rebuilt along more modern lines.

Life in Tokyo has changed substantially since the beginning of the war with China in 1937. The population has increased by about 750,000, largely as a result of the more intensive effort of the war industries, and during the summer of 1940 there was a marked shortage of water as a result of increased demand, drought and greater use of water power for the generation of electricity. Tokyo is a self-governing municipality with a city council and board of aldermen and a mayor at the head of the administration. Tokyo and its environs rank among the four great Japanese industrial regions, the others being Osaka, Nagoya and North Kyushu. The growth of industry during the last years has been considerable; but precise figures are not obtainable, because of the policy of withholding all information relating to munitions industries and war economic developments. The imperial palace in the centre of Tokyo, surrounded by old walls and a moat, is the regular residence of the emperor. Tokyo has its own harbour, although this is overshadowed by the larger neighbouring port of Yokohama. (W. H. CH.)

bu. and the ten-year (1929-38) average was 19,584,000 bu. The 1940 planting was 204,020 ac. compared with 210,550 ac. in 1939 and a ten-year average of 117,260 ac. Seven crops of tomatoes are grown annually in the United States. The table on p. 665 shows acreage, yield, production and average prices of these seven crops in 1940, in 1939 and in the ten-year average as reported by the U.S. department of agriculture.

Planting for fall and winter harvest (1940-41) in Texas and Florida was 15,400 ac. compared with 11,800 ac. the preceding season; Texas 11,000 ac. and Florida 4,400 ac. for 1940-41 harvest and a total production, preliminary indication, of 1,540,000 bu. Cuba exported 77,989,000 lb. of tomatoes to the United States in the 1939-40 season compared with 44,337,000 in 1938-39. (See MARKET GARDENING; TRUCK FARMING.) (S. O. R.)

Tongan Island Protectorate: see PACIFIC ISLANDS, BRITISH.
Tongking: see FRENCH COLONIAL EMPIRE.

Toronto, with a population of 648,398 (1940) and an area of 34 sq.mi., is the largest city but one of Canada and is the capital of the province of Ontario. It is largely concerned in the industries of manufacturing and mining and in the distribution of goods, and for the last-named purpose is advantageously situated at the centre, as between the east and the west, of the buying power of the dominion. Although there has been a heavy enlistment in the forces, increased production of essential goods has kept pace with a large output of war material. Communications by land, air and water are good. Toronto welcomes a great part of the tourist traffic attracted to Canada. The University of Toronto with over 7,200 students is a famous institution of learning and research. The corporation of the city of Toronto owns the street railway and motor bus transportation of the city, the waterworks system and the local hydroelectric system which has exclusive distribution of electricity for light, heat and power. The Canadian National exhibition, in its 63rd consecutive year of operation, is a great annual event which attracted over 1,600,000 visitors in 1940. The well known Royal Winter fair, with its agricultural, livestock and horse show, held annually, grows steadily in importance. (G. R. G.)

Touring: see TRAILER TRAVEL.

Tovey, Sir Donald Francis (1875-1940), British composer, pianist and writer, was born in Eton, July 17, and died in Edinburgh, July 10. For a biographical sketch, see *Encyclopædia Britannica*, vol. 22, p. 330.

Town and City Planning. Defence housing, in part temporary, was under construction in many cities and towns of the U.S. for immediate housing of defence workers; but wherever possible the housing programs were being articulated with local city plans for permanent residential neighbourhoods.

The three Greenbelt towns in Maryland, Ohio and Wisconsin, built with public funds, were opened to private development on 99-yr. leases to builders who agreed to build at least 200 houses. The Farm Security administration retained the right to pass on plans and specifications.

Plans were made at Waverly, Baltimore, Md., to arrest the deterioration of the neighbourhood and the depreciation of homes by salvaging or replacing buildings as needed and by other meth-

ods which would increase open space and maintain a good living standard in the entire district. Cleveland and Cincinnati, O., made plans to redeem their water fronts—Cleveland by a lower mall between the railroad tracks and Lake Erie, and Cincinnati by redevelopment of blighted districts.

In the Cleveland region plans were issued for a modern highway system, including a system of freeways to be built on the following principles: (1) No access from abutting private property; (2) no grade crossings or left turns; (3) limited access from other streets, at steady-flow intersections only; and (4) a centre division strip.

Most modern zoning ordinances in American cities ban billboards in residential neighbourhoods. But zoning is seldom retroactive. Fort Worth, Tex., in 1940 adopted a zoning ordinance which provided for the elimination of all nonconforming billboards within three years. Lake Worth, Fla., a resort town, prohibited billboards within 200 ft. of the street. In Arlington county, Va., a part of metropolitan Washington, nonconforming billboards were scheduled to come down within 90 days.

In New Hampshire, a newly-planned town, Hill, is to take care of the residents of an old town subject to floods. The town will be provided with adequate open spaces and recreational facilities. The site chosen is well removed from the main highway which will be joined to the town by loop connections.

The Massachusetts State Planning board made in 1940 a study of hill towns of Worcester county and proposed plans for their rehabilitation.

Most city planning commissions in the United States prepared six-year budgets for capital expenditures for public works, as requested by the National Resources Planning board. The New York City Planning commission, the first to be charged with the duty of preparing annual and six-year capital budgets of public works to submit to the board of estimate, has made progress. In 1940 the commission was able to include in its estimates the program for assessables as well as public appropriations. The New York zoning law was amended although not to the extent recommended by the planning commission.

Harrisburg, Pa., and Des Moines, Ia., issued comprehensive replanning studies for the city and region. Generally, it may be said that there was a distinct tendency in American cities to increase parks and open spaces and to provide radial and circumferential parkways. An intercity parkway was planned between Baltimore and Washington. New York was (Jan. 1, 1941) joined with New Haven, Conn., by a series of protected, limited-access parkways, similar to the network of parkways in Westchester county, New York. Many modern through highways and parkways avoided traversing large cities and towns. Instead, branch highways provided direct access to the downtown sections of cities.

The re-created Chicago Plan commission reported in 1940 that steps were under way for a new plan of the city.

Track and Field Sports. It is estimated that in the U.S. 4,000,000 persons attended track and field meets during 1940, and that a total of \$12,000,000 was spent for admissions, coaches' salaries, equipment, prizes, etc.

The appointment of Paul V. McNutt as co-ordinator of all health, sports, recreation and other related fields of activity affecting the national defence of the United States indicated that this sport would gain further impetus. Besides this movement for a wider extension of athletics as a national preparedness measure, a bill was introduced in the house of representatives calling for a complete survey of physical education resources throughout the United States.

Wars caused a triple cancellation of the 1940 Olympic games. First announced for Rome about 1934, then Tokyo and later assigned to Finland, plans for the 1940 Olympiad were finally given up. Finland may not have recovered by 1944 to hold the Olympics, and Britain may not be in a position to conduct the games. If wars continue, the 1944 games will not only be jeopardized but fewer international sports will be held in the future, in the opinion of Evan Hunter, secretary of the British Olympic committee.

American athletes created a new and glowing chapter for the record book in 1940. The cream of track and field athletes

staged their own "American Olympics" during the annual national A.A.U. outdoor championships, at Fresno, Calif. Topped by the new world record of Cornelius Warmerdam in the pole vault, of 15 ft. 1 $\frac{1}{8}$ in., Fred Wolcott tied the 200-m. hurdle race world mark of 22.6 sec. set by Jesse Owens, in 1935. Four new American records were also established: 200 m. in 20.4 sec. by Harold Davis; 110-m. hurdles in 13.9 sec. by Wolcott; 400-m. hurdles in 51.6 sec. by Carl McBain and 1,500 m. in 3 min. 47.9 sec. by Walter Mehl, only one-tenth of a second slower than the world record of Jack Lovelock of New Zealand.

In all, eight national A.A.U. metre records were surpassed and two equalled, including those of world and American classifications: 100 m. run by Davis in 10.3 sec.; high jump of Les Steers of 6 ft. 8 $\frac{3}{8}$ in. (he also created a new world record of 6 ft. 9 $\frac{3}{8}$ in. in California); 5,000-m. run by Gregory Rice in 14 min. 33.4 sec.; 1,600-m. relay mark of 3 min. 15 sec. tied by the N.Y.A.C. team. Double victory laurels went to Davis in winning the 100- and 200-m. events, and William Brown in the broad jump and hop, step and jump.

Extraordinary as these feats are, performances in 1940 showed distinctive improvements on 1939 in the astounding number of 15 of the 17 events. In a compilation by Daniel J. Ferris, secretary-treasurer of the A.A.U., the only two events in which 1939 beat 1940 were in the discus throw and in the javelin throw. Only three athletes led in their specialties in both years, Wolcott and Steers showing an improvement in the 120-yd. hurdles and high jump, respectively, and Fox falling two feet behind in his discus throw.

Indoor events.—Indoors, track and field sports continued to surpass each previous year in the number of spectators and competitors. A spectacular turn of events was that the 1-mi. run crown passed from Glenn Cunningham to Charles Fenske, who won eight of the nine publicized mile classics during 1940, his fastest time being 4 min. 7.4 sec. in both the Millrose and the N.Y.A.C. games. Another great performer in trackdom was Gregory Rice, who established a new world mark for 2 mi. in 8 min. 56.2 sec.

Eight records fell in the 17 events of the national A.A.U. championships. The outstanding performance of the meet was the 3-mi. run by Gregory Rice, of Notre Dame, who sped to a new world (indoor) mark of 13 min. 55.9 sec., erasing the 15-year-old record of Willie Ritola. Rice defeated two stellar performers, Walter Mehl and Don Lash. Other new world marks were: Al. Blozis, shot-put, 55 ft. 8 $\frac{3}{8}$ in.; Allen Tolmich, 70-yd. hurdles, 8.4 sec.; Seton Hall College relay team, 880 yd., in 1 min. 32 sec. Four new meet records were: Fenske, 1 mi. in 4 min. 8.8 sec.; Charles Belcher, 600 yd. in 1 min. 11.6 sec.; Earl Meadows, pole vault, 14 ft. 3 $\frac{3}{8}$ in.; Barney Ewell and Mozel Ellerbee equalled

FRED WOLCOTT of Rice Institute, at the right, won the 120-yd. high hurdles of the Drake relays April 27, 1940, at Des Moines, Iowa. It was his third consecutive victory in the annual meet

the old figures of 6.2 sec. for the 60-yd. dash. Joe McCluskey's 2-mi. steeplechase victory represented his 21st national title.

CHARLES FENSKE (left) outdistanced the four other greatest milers of the track Feb. 24, 1940, at New York city to win the U.S. indoor championship. In the centre of the picture, taken on the 9th lap, is Glenn Cunningham, who finished fourth, and Lou Zamperini, who was third. Gene Venzke was second

U.S. championship track events indoors went back to the yardage basis (field events have always been measured by yards) after ten years of metric measurements. Outdoor A.A.U. title events continued with metres for track events.

New construction technique was being developed in building indoor tracks that make for faster performances. On the especially constructed large indoor track at Dartmouth college, Hanover, N.H., many new world marks were established. (Cunningham ran the 1 mi. there in 4 min. 4.4 sec. several years ago.) Eight new world marks turned in on the Dartmouth track were listed as such by the A.A.U., aside from other indoor marks made on normal tracks measuring 8 or 9 laps to the mile. Those Dartmouth records were: John Woodruff, 880 yd. in 1 min. 47.4 sec.; 800 m. in 1 min. 47 sec. James Herbert, 440 yd. in 48.4 sec.; 400 m. in 47.9 sec. John Borican, three-quarter mile in 3 min. 0.5 sec. New York university relay team, 880 yd. relay in 1 min. 27.7 sec.; 1-mi. and 1,600-m. relays in 3 min. 15 sec.

Princeton Meet.—The Princeton track meet in Palmer stadium, always the scene of stirring competition and new records, saw Fred Wolcott skip over the 220-yd. low hurdles in 22.5 sec. Another great collegian was Paul Moore, of Stanford, whose outdoor three-quarter-mile run in 2 min. 58.7 sec. clipped nearly 2 sec. off the official world mark set by Jules LaDumegue, of France, in 1931; he also bettered the world mark of 2 min. 59.5 sec. by Sydney Wooderson, in London, in 1939. Another new outdoor mark was established by Rice during his victory over Taisto Maki, of Finland, in a 3,000-m. race, in Minneapolis, in 8 min. 18.9 sec., breaking the American record by 7.5 sec.

In college competition, Southern California's Trojans were again unbeatable, capturing the National Collegiate A.A. title. University of Michigan topped all opposition in the Big Ten conference by winning both the indoor and outdoor track and field titles. In I.C. 4-A competition, University of Pittsburgh took the outdoor title without winning a first place and New York university captured the team trophy indoors.

Women.—The efforts of women in track sports in the United States also continued on the uphill. The top annual fixture, the national A.A.U. championships, at Ocean City, N.J., drew entries from 11 states. The highest point scorer was the perennial veteran, Stella Walsh of the Polish Olympic Women's club, of Cleveland, winning 28 points by capturing the 200-m. race, the broad jump and second in the 100-m. dash. Jean Lane took both the 50- and the 100-m. dash.

Catherine Fellmuth, another double winner, was successful in the discus and 8-lb. shot.

Europe.—War called many of Europe's outstanding athletes to serve their respective countries. Sydney Wooderson put aside his uniform and broke the Scottish 1-mi. record, with a 4 min. 11-sec. performance. Another soldier-athlete, John Loaring, of Canada, won the 220- and 440-yd. runs and the broad jump at a meet at the Portsmouth naval base. August Milligan, British shot putter who lost his right arm in France, was learning to toss the shot with his left hand. Oxford boasts of an outstanding freshman broad jumper, John Morrish, who did 24 ft. in practice after his 23 ft. 2 in. in the Oxford-Cambridge meet.

In the triangular track meet between teams from Finland, Germany and Sweden, held in the new stadium at Helsingfors, built for the 1940 Olympics, Sweden gained 147 points against Germany's 141 and Finland's 134. The Swedes took first places in the runs above 1,500 m., the Germans won the short distances and the Finns captured the jumps. About 115,000 people attended the two-day meet.

Canada.—The Canadian National exhibition attracted 50,000 people for two track meets during the Labor day week end in which many Americans competed. Tom Flagg won a notable "double" sprint and Joe McCluskey, of New York, was nosed out by a yard by handicap men in the two feature events. Jim Gable, of the R.A.F., won the 1-mi. walk. Miss Stella Walsh scampered to four easy victories over Canadian women. Gerald Cote, Canada's great marathon runner, was awarded the dominion medal for being the outstanding athlete of 1940. (J. B. P.)

Trade Agreements. On April 12, 1940, President Roosevelt signed an act of congress extending for a period of three years from June 12, 1940, the authority to enter into trade agreements with foreign countries. By the beginning of 1940 trade agreements had been concluded with 21 countries; namely, the United Kingdom (including Newfoundland and the non-self-governing colonies), Canada, Belgium, Sweden, the Netherlands, Switzerland, France, Finland, Czechoslovakia, Turkey, Cuba, Haiti, Brazil, Honduras, Colombia, Guatemala, Nicaragua, Costa Rica, El Salvador, Ecuador and Venezuela. The proportion of total United States trade which was conducted with trade agreement countries in 1939 is indicated in the chart on next page.

In view of the fact that the trade of the United States and of the areas covered by the United States trade agreements constitutes more than 60% of the foreign trade of the world, it is evident that the U.S. program, built upon the principle of lowered trade barriers and non-discrimination, and designed to counter the crippling and provocative trade practices which followed the economic crash of 1929, has proved practical and effective.

The United States trade agreements program grew out of the conditions and needs resulting from the world depression following 1929. Nations had entered into feverish competition with each other to sell to foreigners a maximum and to buy from foreigners a minimum of goods. Trade barriers had been built up to unprecedented heights. To constantly mounting tariff walls were added entirely new economic devices for regulating trade—quota restrictions, exchange controls, government trade monopolies and export and import licensing requirements. The trade highways of the world became blocked with impassable barriers. International trade fell to a third of its 1929 value. From 1929 to 1933 the value of United States foreign trade fell from \$9,640,000,000 to only \$3,125,000,000. The resulting economic dislocations gave rise

to widespread suffering and social unrest.

To meet this national emergency, legislation designed to increase foreign trade was worked out upon the basis of three principles of tariff making, each of which had been separately adopted heretofore in United States legislation, but which in combination were entirely new. The three principles are these: (1) Congressional delegation to the president of the power of tariff adjustment within prescribed limits. (2) Tariff negotiation by executive agreement. (3) Generalization of all tariff reductions (except those granted to Cuba) to the products of all countries which do not discriminate against U.S. commerce.

The Trade Agreements act, signed on June 12, 1934, offered a new program based upon these principles. The act authorized the president "for the purpose of expanding foreign markets for the products of the United States" (1) "to enter into foreign trade agreements" and (2) "to proclaim such modifications of existing duties . . . or such additional import restrictions, or such continuance . . . of existing customs or excise treatment of any article covered by trade agreements, as are required or appropriate to carry out" such agreements. The president may not modify existing customs duties beyond 50% nor may he transfer any article between the dutiable and the free lists. The duties thus proclaimed by the president are made applicable to the products of all countries, except that the president may suspend their application to the products of any country "because of its discriminatory treatment of U.S. commerce or because of other acts or policies" which tend to defeat the purposes of the act. The exceptional situation of Cuba is recognized by a provision for an exclusive preferential agreement with Cuba, thus continuing the preferential relationship established by the Commercial Convention of 1902.

The trade agreements program, designed to combat existing world tendencies toward economic nationalism, has a two-fold objective. It seeks, first, the reduction or elimination of excessive trade barriers. Trade barriers such as impede international commerce cause diminished national incomes, depressed standards of living, increased unemployment, financial instability and social unrest. The second objective of the program is the elimination of trade discriminations. Trade discriminations lead to constantly shifting trade currents, commercial uncertainty and insecurity, recriminations and retaliations, trade conflict and the kind of economic tensions that lead to war.

The success of the program was marked. Concessions—including duty reductions, quota increases and bindings of existing customs treatment—have been obtained in trade agreements on about three-fourths of the total agricultural imports and on about one-half of the nonagricultural imports of the trade agreement countries from the United States. For all products combined, agreement countries have granted concessions on nearly 56% of their imports from the United States.

Because of the disruptive effects of the war in Europe and hostilities elsewhere, it would be difficult, if not impossible, to measure statistically the effects of the trade agreements program in 1940. However, the influence of the program in stimulating the foreign trade of the

INCREASE IN UNITED STATES EXPORTS AND IMPORTS under the trade-agreements program. The chart shows increase of 1938 and 1939 (average) over 1934 and 1935 (average). Trade with Ecuador, the British agreement area, Venezuela and Turkey is not included, since agreements with them were not in effect during all of 1938 and 1939

United States is indicated in the chart above, which shows the increase during the two-year period of 1938 and 1939 over the two-year period of 1934 and 1935 of exports to, and imports from, trade agreement countries as compared with other countries.

Armed conflict in progress in other parts of the world in 1940 confronted the United States with many serious and difficult problems, not the least of which were the dislocations suffered by international trade and finance. As a result of these maladjustments growing out of foreign wars, the maintenance of the liberal trade principles of the trade agreements program became an important factor in the national defence program of the United States.

(See also INTERNATIONAL TRADE; TARIFFS.) (H. F. G.)

Trade Unions: see LABOUR UNIONS.

Traffic Accidents. Motor vehicle accidents took a toll of 34,400 lives in the U.S. during 1940. This was 2,000 more than in 1939—a 6% increase. The fatality increase was paralleled by a corresponding rise of 6% in motor vehicle travel. The death rate on a mileage basis therefore remained unchanged. During both years twelve persons lost their lives for every 100,000,000 vehicle miles travelled.

The 6% increase in total traffic deaths was attributed to four causes. They were: (1) Increased exposure. In addition to a 6% increase in mileage, the number of vehicles in use increased 4%. (2) Loss of trained traffic control personnel through selective service and defence industry demands, accompanied by some shift of official attention from traffic. (3) Psychology of the war situation on both officials and the public. (4) An economic upswing accompanied by increased use of intoxicants.

Outstanding achievements in the field for 1940 may be grouped under the headings of the model highway safety program which was drafted and endorsed by 12 leading organizations interested in safety in the United States.

Legislation.—Continued adoption by cities of the Model Municipal Traffic Ordinance as drafted by the National Conference on Street and Highway Safety; drafting of bills in many states for submission to 1941 legislatures seeking improved traffic laws in conformance with the uniform vehicle code.

Motor Vehicle Administration.—Improvement in motor vehicle administration in states with more adequate accident reporting systems, a better examination for new drivers, more efficient suspension and revocation of drivers' licences for cause and renewed efforts to cancel "good until revoked" operators' licences and replace them with definite term licences.

Enforcement.—Broader use of standard procedures and techniques in traffic law enforcement and accident investigation together with a general increase in traffic police personnel; improved and more uniform traffic court procedures and practices; completion of studies by the national committee on traffic law enforcement seeking to raise the general level of traffic court procedures and police procedures in traffic law enforcement.

The traffic court report was adopted by the American Bar association and the police report by the International Association of Chiefs of Police.

Education.—Co-operation of 73 colleges and universities in conducting academic credit courses in safety education during the summer of 1940; increases in driver training courses offered in high schools with 7,800 schools offering classroom courses, 300 of which were supplemented by actual road lessons; inclusion of approximately 310,000 children in grade school safety patrols in 3,250 cities and towns; increase in number and scope of community safety organizations and continued improvement and expansion in the field of adult safety education.

Training Personnel.—A pronounced increase in the training of traffic safety engineers, educators and enforcement personnel during 1940; continued co-operation of universities and safety organizations in conducting effective training programs; development and expansion of departmental training schools for field personnel of state and municipal police agencies. Principal training agency for traffic engineers was the Yale University Bureau for Street Traffic Research; for educators, the New York University Center for Safety Education; for traffic police, the Northwestern University Traffic institute.

Engineering.—A distinct trend toward more and better traffic engineering. A majority of state highway departments, together with an increased number of cities, employed qualified traffic engineers.

BIBLIOGRAPHY.—American Automobile association, *Driver Education and Training Manual for High School Teachers*; Northwestern University Traffic institute and the International Association of Chiefs of Police, *Accident Investigation Manual and The State and Provincial Police*; National Safety Council committee reports dealing with intoxication, night driving, winter driving hazards, speed, pedestrian control and the bicycle problem.

(F. M. K.)

Trailer Travel. With sales indicated at approximately \$18,000,000 during 1940, a great increase in the use of automobile trailer coaches was taking place. During the year new and enlarged plants were erected and engaged to meet the growing demand for trailer coaches. The present national defence program, involving the establishment of many new munitions-making factories in locations remote from housing facilities, made the trailer coach an important factor in quickly supplying temporary living quarters for workers.

Science and industry, too, have found the trailer coach to be useful for many purposes. For salesmen who carry lines too heavy to transport by auto, or products which can best be demonstrated "on the job," the trailer coach was growing in popularity. Rural hospitals, dental and medical clinics, branch and travelling libraries, mobile X-ray laboratories and photographic studios are a few of the uses to which they have been put.

The U.S. government was using trailer coaches in an ever-increasing amount—for recruiting offices, for radio and photographic work, for field hospitals, officers' headquarters and for many other purposes.

State governments also were drawing upon the industry for substantial numbers of trailer coaches for their highway and police departments and for other purposes. Employees and performers of circuses and carnivals, travelling musical organizations, etc., found in them an excellent mode of transportation and housing.

They continued to be popular, also, among vacationists and the

large segment of retired people who spend their winters in the south and much of their summers in the north.

During 1940 there was a decided trend towards larger and better trailers, according to the Trailer Coach Manufacturers' association, which gathers production statistics from the principal manufacturers in the industry. Nearly 70% of the trailer coaches purchased during 1940 ranged in price between \$700 and \$1,200. More than 90% of those made were from 17 to 24 ft. in length—the larger portion being towards the longer length. One of the noticeable trends in 1940 was the shift to air-conditioning, improved ventilation and insulation, and finer construction throughout. Mechanical refrigeration was rapidly increasing in popularity through the availability of an increasing number of trailer parks throughout the country, where full utility services were made available to the trailer dweller on his stops. While no definite data are available, well informed opinion estimates that in 1940 there were approximately 300,000 trailer coaches in use for commercial, government, pleasure and temporary housing purposes.

(P. E.)

Trans-Jordan. Trans-Jordan lies to the east of Palestine and is bounded on the north by Syria, on the northeast by Iraq, on the southeast and south by Saudi Arabia. It is an Arab principality which forms part of the British-mandated territory of Palestine. Like the land west of the Jordan, it is under the supervision of the British high commissioner for Palestine and Trans-Jordan, Sir Harold MacMichael, but it is ruled by a native prince, Emir Abdallah Ibn Hussein, and has a constitution providing for a council of ministers under Tawfiq Pasha Abdul Huda as premier and an elected legislative assembly. Although the country is three times as large as Palestine west of the Jordan, and covers an area of 34,740 sq. mi., it has a population estimated at only 350,000. Most of the people are Arabs, but there is a minority of Circassians. The religion of the inhabitants is Mohammedan, except for about 25,000 Christian Arabs, mostly Greek Orthodox and living in the town of Es-Salt. The capital is Amman (the ancient Rabbat Ammon and in Hellenistic times called Philadelphia), which has lately been transformed into a modern city and counts about 25,000 inhabitants.

During the year 1940 the attention of the government was centred on furthering the development of the country by settling the largely semi-nomadic tribes and by improving agricultural methods, and on strengthening defence forces which gained a new importance in view of unsettled conditions in the near east as a result of the European war. Emir Abdallah and the government of Trans-Jordan remained loyal to Great Britain and the resources of the country were put at the disposal of the defence of the near and middle east. No actual warlike operations disturbed the country, but the population followed closely the events in the neighbouring countries of Palestine and Syria. Emir Abdallah was known to harbour plans for the unification of these countries under his leadership, but no change could be contemplated so long as military operations were still continuing and the outcome of the war remained uncertain.

(H. Ko.)

Transylvania: see HUNGARY; MINORITIES; RUMANIA.

Trap-shooting. There were in 1940 nearly 1,000,000 shooters in the United States who spent an average of \$50 during the year for shells and accessories, not counting the cost of guns, a total of \$50,000,000. The big event of the year was the Grand American championships at Vandalia, O., attended by more than 1,000 of the leading shooters. A new champion was crowned in 1940, E. H. Wolfe, of Charleston, W. Va., who broke 98 clay birds out of 100, from the 23-yd. mark. The champion

of champions title was the reward of the marksmanship shown by Samuel Sharman, of Salt Lake City, Utah.

The North American title was won by Forest McNier, of Houston, Tex. and the class A.A. was admirably won by H. G. Albright, of Excelsior, Minn. H. L. Cheek, of Clinton, O., took the all-around amateur championship, breaking 1,131 out of 1,200 disks, while C. C. Mitchell won the corresponding professional title with 1,137 "birds." Mrs. Lela Hall, of Strasburg, Mo., again proved her right to the women's trap-shooting title with 95x100 from 22 yd. Fred Tomlinson, of Glassboro, N.J., was the new professional champion.

Walter S. Beaver, of Conshohocken, Pa., was the outstanding figure in the national amateur championship three-day shoot at the New York Athletic club's traps at Travers island, when he took the doubles title with 92x100 birds; tied for the national singles title the following day with 197x200, but lost to D. Franklin Beck, of Havre de Grace, in the shoot-off; and in the distance handicap championship on the third day, shooting as scratch man from the 25-yd. mark, broke 95x100, only one less than the winner, Merton J. Cushman, of the New York A.C., from the 19-yd. line.

Of the several leading annual tournaments, the Atlantic Indians championship drew the spotlight because of the two-gun duel between L. G. Dana and Thomas Young for class A title. It was finally won by Dana with 200 "kills" in a row. Roger Fawcett won the 16-yd. crown, Tom Marshall captured the doubles event and Harry E. Brown shot his way to victory in the class championship events.

Joe Hiestand won the marathon race at the 20th annual T. Clarence Marshall trap-shooting tourney at Yorklyn, Del., scoring 498x500; H. C. Jones won the Brandywine title with 200 straight; H. P. Messler took the Special, 150x150; Elbert Mount won the T. Clarence Marshall handicap, 145x150. There were 450 shooters who used 130 clay birds and an equal number of shells during this four-day shoot.

(J. B. P.)

Trinidad: see WEST INDIES, BRITISH.

Trotha, Adolf Lebrecht von (1868-1940), German vice-admiral, was born March 1 in Coblenz and was graduated from the German naval academy in 1900. He served in China during the Boxer uprising. In 1916 he was chief of staff of Admiral Scheer during the battle of Jutland. From March 1919 to Sept. 1920 he was chief of the German admiralty. In the latter year he took part in the Kapp "putsch" and was dismissed from the service. He wrote several books on naval strategy as well as a life of Admiral von Tirpitz. He died in Berlin on Oct. 11.

Trotsky, Lev Davidovich (1879-1940), Russian politician, was born near Elizavetgrad, Russia. For his biography, see *Encyclopædia Britannica*, vol. 22, p. 497. After taking refuge in Mexico in 1937, he lived for a time with Diego Rivera, the Mexican artist, but disagreed with him and took a house in the suburbs of Mexico City. An attempt on his life was made May 24, 1940, and the assailants escaped. Another attack was made on August 20 by a man whom Trotsky described as an agent of the Russian OGPU. His injuries were so serious that he died the next day.

Trucial Sheikhs: see ARABIA.

Truck Farming. Fourteen principal commercial truck crops showed an increase in acreage planted for fall and winter harvest, for the 1941 season, of 16% over the 1940 season and 17% larger than the 1930-39 average. Truck crop planting during 1940, both for summer and for fall and winter harvest, marked an upward trend in acreage after three years of decline ending in a low in 1939. Truck farming in the U.S., the department of agriculture points out, normally follows a five-year cycle consisting of three years of declining acreage followed by two years of increased acreage. The combined pack of the important truck crops grown for canning in 1940 was estimated by the department of agriculture as 103,000,000 cases of 24 no. 2 cans to the case, compared to 94,900,000 cases in 1939. The carry-over from 1939 was about 11,500,000 cases, or less than one-half of the carry-over from 1938, leaving, with the 1940 pack, a supply of approximately 115,000,000 cases compared to 120,-

Per Capita Consumption of Canned Vegetables in U.S.

	1920-24 lb.	1935-39 lb.
Asparagus	0.38	0.48
Beans (snap)	0.72	1.76
Beets	0.23	0.63
Corn	3.60	3.98
Peas	3.06	4.66
Pumpkin and squash*	0.36	0.40
Spinach	0.48	0.88
Tomatoes	5.10	5.72
Tomato pulp and juice	0.59	3.33

*1925-29

100,000 cases in 1939. There was an unusually large pack of peas in 1940, about 25,500,000 cases. Per capita consumption of canned vegetables in the United States has increased from 14 lb. in the five-year period of 1920-24 to about 22 lb. in 1940. This does not include frozen vegetables or cucumbers and cabbage processed as pickles and kraut or tomatoes in sauces and soups. Of these also there has been a large increase in consumption during the same period. Nor does it include consumption of fresh vegetables which also has increased. (See MARKET GARDENING.) The table shows the per capita increase in the consumption of canned vegetables in the United States in two different periods (1920-24 and 1935-39) as shown by the department of agriculture. (S. O. R.)

Trucks: see MOTOR TRANSPORTATION; MOTOR VEHICLES.

Tuberculosis. **Diagnosis.**—The accuracy of the tuberculin test was again confirmed by Musacchio (Detroit) on 1,000 patients in a hospital for the tuberculous; 97% reacted to the test. The tuberculosis committee of the American School Health association urged that it be the first step in the detection of tuberculosis among school children and personnel of all schools. The tuberculosis committee of the American Student Health association made a similar recommendation. Both organizations regard the intracutaneous method of Mantoux as the standard procedure.

The number of children infected with tubercle bacilli is definitely decreasing. For example, Jordan (Minnesota) tested school children about 1930 and found 14% reacted, whereas, in the same areas in 1940, 6.7% reacted.

During the school years 1938 and 1939, the tuberculosis committee of the American Student Health association reported that 82,774 students in various parts of the United States were tested and 25.5% reacted.

Several methods of making X-ray inspections of the chest were used during 1940. J. Rodriguez Pastor (Puerto Rico) found the fluoroscope of value. Potter (Chicago) and Douglas (Detroit) did X-ray inspections of the chests of 1,610 persons with standard size X-ray films (14x17 in.) and also with miniature films (4x5 in.). The miniature film revealed evidence of disease in 2.6% less than the standard size film. In a test for speed, they exposed the chests of 73 persons in 65 min. Roentgenphotography (35 mm. films) was also employed in various parts of the world.

Clinical and Special Examinations.—Koganas *et al.* (Lithuania) improved the method of examining stomach washings for tubercle bacilli, which materially shortens the time required to determine whether tubercle bacilli are present.

Rosencrantz *et al.* (California) studied stomach washings of 169 children who reacted to tuberculin by inoculating guinea-pigs. In 76 cases the animals developed tuberculosis. These children had tuberculosis in various forms; in fact, bacilli were found in seven with calcified lesions in the lungs and in six in whom no disease could be found in the lungs but was present in other parts of the body. This method of examination has been used extensively.

Lester (Copenhagen) again called attention to bacilli which have the same staining qualities and appear precisely the same under the microscope as tubercle bacilli. She points out the danger of making a diagnosis until it has been determined whether the organisms produce disease in inoculated animals.

Mass Examinations and Special Groups.—In Canada, all war recruits have X-ray film inspection of the chest. Adamson (Winnipeg) and Jones (Ottawa) reported that about 1% have been eliminated from service because of tuberculosis. Berner (Frankfurt-on-Main) made X-ray inspections of the chests of 640,000 citizens of Mecklenburg. He found suspected tuberculosis in 1.25%. Bentley and Leitner (London) pointed out that in the countries at war, such as France, Belgium and Germany, large numbers were examined and approximately 1% were found with shadows due to tuberculosis.

Provisions were being made in 1940 for examinations of the chests of all persons entering the army and navy of the United States. During and since the World War of 1914-18, tuberculosis among men who were in service has cost the United States approximately \$1,000,000,000 and other countries have suffered proportionate losses.

In the state of New Jersey a law was effective in 1940 which required adequate examinations for tuberculosis of the personnel of the entire school system as well as all students of high school age. Already this has brought to light cases of unsuspected tuberculosis.

Pollak (Jersey City, N.J.) reported the incidence of tuberculosis among nurses so high that he concluded wherever patients with communicable tuberculosis are treated, strict contagious disease technique should be employed to protect nurses. He recommended that all students and graduate nurses be examined with tuberculin and the reactors have periodic X-ray film inspection of the chest.

Ferguson (Saskatchewan) reported an incidence of tuberculosis among student nurses of 1.44% per annum as compared with an incidence of .15% among women of the same age in the general population of Saskatchewan.

Davies (Port of Barry, Wales) found a high incidence of tuberculosis among seafarers. It occurred among those on vessels both in temperate and tropical climates.

Wohlhueter-de Loriol (Strasbourg) found an alarming number of seamstresses with tuberculosis; in fact, among 500, 90 had active tuberculosis. He believes the dust produced by the manipulation of tissues and especially the siliceous elements used in finishing materials is an important factor and that the silica increased the proliferation of tubercle bacilli.

Treatment.—Sulphanilamide and sulphapyridine, so effective in such diseases as gonorrhoea and pneumonia, have been found by Reimann (Philadelphia) and Follis *et al.* (Baltimore) to inhibit the development of tuberculosis in laboratory animals. Corper (Denver) believed the apparent inhibitory effect in experimental animals to be due to the toxicity of the drugs rather than any specific action and, therefore, they should not be used in cases of tuberculosis except for co-existing diseases for which they have been found of definite value.

Sulphathiazole has been found to have little or no effect on the course of tuberculosis in guinea-pigs. No one has yet reported any of these drugs as having a significantly beneficial effect on tuberculosis in man.

Prognosis.—Johnston *et al.* (Detroit) removed 838 children who reacted to tuberculin from contact with tuberculosis in their homes and followed them in boarding homes over varying periods up to 12 years. Twenty-three developed clinical tuberculosis after contact was broken. Sartwell (Boston) pointed out the dangers of infected children developing clinical tuberculosis in adult life and emphasized the importance of periodic examinations.

The mortality from tuberculosis in the United States was 46 per 100,000 in 1939; it was 79 in 1928 and 202 in 1904.

Prevention.—Marked advances have been made in the protection of members of hospital personnel against tuberculosis. Harrington *et al.* (Minneapolis) by using strict contagious disease technique definitely reduced the number of infections of students of nursing.

Tytler *et al.* (Cardiff, Wales) concluded that contaminated books are a serious problem and should be sterilized by dry heat. Cheap, soiled books which have been much exposed to tuberculous patients should be destroyed.

Hall (New Rochelle, N.Y.) called attention to the dangers of children becoming infected with tubercle bacilli through contact with tuberculous servants and teachers. He strongly recommended periodic examinations of all such persons.

Collins (New Brunswick) emphasized the importance of the care of tuberculous patients after their disease comes under control, with particular reference to rehabilitating them. Hochhauser (New York) recommended that sheltered workshops be provided for tuberculous patients whose disease is brought under control.

Young and Faber (Tyler, Texas) called attention to the problem of tuberculosis in athletes and strongly recommended that all high schools and colleges provide adequate examination of athletes to detect symptomless, clinical tuberculosis.

Spector (St. Louis) found that when tuberculosis in the contagious stage develops in a husband or a wife, the risk of the consort is 29 times greater than for persons in the general population.

Lee (Shanghai), on the basis of tuberculosis mortality rates in China, estimated that there are approximately 1,200,000 deaths annually in that country and 12,000,000 persons who have the disease in clinical form at all times.

The committee of the American Student Health Service association was not convinced that vaccination with BCG is a satisfactory method of protecting students against tuberculosis.

Tuberculosis in Animals.—Feldman (Rochester, Minn.) found tuberculosis in 75 of 264 garbage-fed hogs. In 47 he typed the tubercle bacilli and found that 35 had the avian type of disease and 12 the human type. He strongly recommended that unselected garbage should not be fed to swine in an uncooked state.

Hedvall (Lund, Sweden) reported 65 cases of tuberculosis in man which had been contracted from cattle. He found that the bovine type of tuberculosis in man does not differ from that produced by the human type of tubercle bacillus.

Ichok (Paris) studied tuberculosis in rural areas and found an exceptionally high incidence among young women but a low incidence among middle-aged men. Because of the consumption of raw milk the bovine type of tubercle bacillus played a greater part in the spread of disease in rural areas than in towns.

On Nov. 1, 1940, it was announced that all the counties in the United States had been rated as modified accredited with reference to tuberculosis in cattle. This is the world's most outstanding accomplishment in tuberculosis control. When a well organized program began in 1917, tuberculosis among cattle was a serious disease not only because of the economic loss but also because it was transmissible to man. In the 23 years required to accredit all U.S. counties, more than 230,000,000 tuberculin tests were administered to cattle and almost 4,000,000 reactors were slaughtered and examined at post-mortem. From this extensive experience the veterinarians and their allies were convinced that the tuberculin test is more than 97% efficient.

Tungsten. The world's tungsten producing industry centres mostly in southeastern Asia, whence came 65% of the 1939 total, estimated at 41,000 metric tons of concentrates (60% WO₃ basis), a 10% increase over 1938; 28% of this total came from China, 24% from Burma, 3% from Malaya and 8% from other adjacent territories, chiefly Chosen. Of production elsewhere, the United States supplied 10%, Bolivia 8%, Argentina 3% and Portugal 9%; other outputs are small and widely scattered.

Due to the disturbances incident to the Japanese invasion of China, the Chinese exports for 1939 dropped 35% below those of 1937 and early reports for 1940 were at a still lower level, mostly through Indo-China. Exports from Burma during the first half of 1940 were somewhat below the 1939 average, but Argentina during the first ten months held to the 1939 level.

The United States industry is very erratic, and in spite of exceptionally heavy tariff protection is more or less at the mercy of world prices; production has been increasing, however, since the depression low in 1932, reaching 3,889 metric tons in 1939. In addition to the domestic output in 1939, the U.S. imported for consumption about 1,400 metric tons of concentrates (60% basis), 560 tons for smelting and export, and small amounts of metal, alloys and compounds. In addition, ore imported and stocked in bond amounted to 1,550 tons. Imports were radically increased in 1940, the 60% equivalent of imports for consumption for the first ten months being 3,950 tons and imports for smelting

and export, 1,280 tons.

The British empire controlled 32% of the 1939 world output, in Burma, Malaya, Australia, southern Africa and Cornwall.

Germany is the largest consumer of tungsten, with imports of 15,400 metric tons (60% basis) in 1938 and 6,200 tons in the first half of 1939. War conditions may be expected to increase the demand for tungsten in appreciable amounts. (See also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Tunis: see FRENCH COLONIAL EMPIRE.

Tunnels. The year 1940 produced much activity and diversity of tunnelling conditions and design in earth and rock with and without stabilization of "soft" earth by use of low compressed air in workings to facilitate mining operations. The U.S. health service and the U.S. bureau of mines instituted an experiment in 1939 in the tunnel construction works of the New York city Queens-Midtown tunnel in the attempt to minimize compressed air illness by equipping the workers with masks and containers of pure oxygen during the process of exit from tunnel workings, otherwise known as the stage of decompression. No practical conclusions on this experiment were available in 1940, but with improvements since 1905, the work was highly successful in protection of the health of compressed air workers. This facility was opened to the public on Nov. 15, 1940. It is an exceptionally good example of lighting a highway in tunnel.

The city of Chicago, Ill., presented the most outstanding and delicate example of tunnelling under compressed air in the construction of its passenger transit subway system of almost eight miles of double track tunnels. Very good progress was made during 1940. The double track twin arched rectangular portions between stations, in length about four and one-half miles, were completed and were mined with the use of steel "liner" plates. On the large station tunnel sections good progress was made with the use of shields despite certain hazardous conditions, including removal of the old freight tunnel in the path of the new. Also in Chicago about two miles of 16 ft. diameter water tunnel was completed to serve Chicago's south side water filtration plant.

New York city completed the independent subway's Sixth avenue extension from Ninth street to 53rd street and opened it to the public on Dec. 15, 1940. This work involved very complicated operations in compressed air mining, underpinning and rock excavation in the immediate vicinity of other important structures.

In London, where practically all of the underground railway system is situated in London clay at great depth below street surface, the construction of certain authorized extensions were discontinued about the beginning of the year owing to the war, but not until a radical departure in construction of these tunnels had been tried. Owing to difficulty in obtaining cast iron lining, it was decided to build these circular tunnels with segments of ferro-concrete. The flanges and webs were of dimensions suitable for Portland cement concrete and were bolted together in the usual manner through holes formed by steel tubing in the flanges. Construction by this means proved satisfactory and the cost was considerably less than usual. In this respect it should be borne in mind that, in general, London clay, though it can behave badly under exposure to the air, is practically free of water. The promotion of the great system of deep underground railroad tunnels under London did not contemplate its use as an air-raid shelter. When the first unit of this system was opened to the public in Oct. 1890, the aeroplane had not begun to fly. Nevertheless, the many stations and foot passages connected with this passenger transit system in 1940 gave full protection against bombs dropped from aeroplanes. They are many miles in extent. The construction of highway tunnels in London under the river

SECOND LONGEST of the Pittsburgh-Harrisburg turnpike's seven tunnels is Allegheny tunnel—6,070 ft. in length. This superhighway in Pennsylvania was opened to traffic Oct. 1, 1940

Thames from Purfleet to Dartford, about 20 mi. downstream from London bridge, remained dormant because of the war.

Sunken tunnels are passages under waterways constructed by excavating a trench and sinking in place pre-fabricated sections end to end. They constitute an alternative to actual tunnelling. At Mobile, Ala., a highway tunnel of this character was completed, but was by Jan. 1, 1941, not yet in operation. Also at Rotterdam, Holland, under the river Maas, a trench tunnel was well under construction when stopped by the war. This has a capacious under-river cross-section, about 82 ft. wide by 30 ft. deep, providing two vehicle highways, cyclist and pedestrian passages, all four independent of each other. The construction operations were well and ingeniously planned.

In the sphere of rock tunnelling much was done in the United States. The city of New York's Delaware aqueduct water supply tunnels, in length about 85 mi., were progressing rapidly. The southern half of this system was well toward completion. The northern half will be completed by 1942.

The Pennsylvania turnpike tunnels through the Allegheny mountains between Harrisburg and Pittsburgh were completed and form an example of very high speed work. This 160-mi. highway with its seven miles of tunnels, was opened to the public on Oct. 1, 1940.

(J. FE.)

Turkestan, Chinese: see SIN KIANG.

Turkey, a republic in southeastern Europe and western Asia, has an area of 296,500 sq.mi. and a population of about 18,000,000. The population is predominantly Turkish, with a considerable minority of Kurds in the eastern provinces; the religion is Mohammedan. The capital is Ankara in Anatolia, with 125,000 inhabitants; the two largest cities and ports are Istanbul with 700,000 and Izmir with 175,000 inhabitants.

Turkey, which before the World War of 1914-18 had been the centre of the Ottoman empire, was completely reorganized along modern and progressive lines after 1923 by Mustafa Kemal, who was president of the Turkish republic until his death in the fall of 1938, when his collaborator of many years, General Ismet Inönü, was elected president and followed generally the lines laid down by his predecessor, under whom Turkey had followed a consistent policy of peace and reconstruction. It had concluded an alliance with its old adversary, Greece, and had built up the Balkan Entente with Greece, Yugoslavia and Rumania, on the one

hand, and the near eastern pact with Iran and Iraq on the other, to find a firm basis for peace. Turkey had pursued a policy of close friendship with the soviet union, the heir of Turkey's most embittered enemy for 200 years, the Russian empire. With Germany's aggressive policy in 1939, Turkey found its system of peace endangered. It was especially afraid of a long-threatened attack by Italy on Anatolia, which the fascist power had prepared by the fortification of the Dodecanese islands lying just off the southwestern shores of Anatolia. Under these conditions Turkey concluded a treaty of mutual assistance with Great Britain and France on Oct. 19, 1939, in the event of war breaking out in the Mediterranean. Turkey, however, stipulated in that treaty, the duration of which was fixed for 15 years, that its obligations would not hold if they involved Turkey in hostilities with the soviet union. Strengthened by this pact Turkey strove at the beginning of 1940 to organize the Balkan powers for concerted action against any aggressor, but Turkey's efforts failed, and the conference of the Balkan Entente at Belgrade in Feb. 1940 confined itself to vague generalities. Thus Turkey found itself thrown upon its own resources and its alliance with Great Britain. Great care was taken to put the army on a footing of the highest efficiency and to exercise a strict watchfulness against the many German experts and spies in the country. Several large-scale plots were discovered, and as a result the Turkish government dismissed and expelled a number of German nationals. A new trade treaty with Great Britain in Feb. 1940 was to increase the commercial exchanges of the two countries.

The situation changed for Turkey when Italy entered the war and, a few days later, when France surrendered. Turkey's attention centred immediately upon the neighbouring French-mandated territory of Syria, which Turkey did not wish under any circumstances to have fall into German or Italian hands, and so to become a menace in Turkey's rear. An agreement was concluded with Iraq about common measures for such an eventuality. The successful resistance of Great Britain to German attacks across the English channel, and even more the inability of Italy to make any headway in the Mediterranean against the British position, increased Turkey's determination to remain faithful to its British alliance and to defend its territories by arms against Germany or Italy, if the need should arise. In spite of the pressure brought to bear upon Turkey by Germany's ambassador in Ankara, Franz von Papen, all efforts to make Turkey accept Germany's "new order" proved of no avail. In spite of the uncertain character of the relations between the soviet union and Germany, Turkish leaders frequently expressed the conviction that they would count at least on the tacit approval of the soviet union in their determination to resist fascist aggression. This attitude was made irrevocably clear by the Turkish president in his speech to the Kurultay, the Turkish parliament, on Nov. 1, after Italy's invasion of Greece. He pointed out that Italy, under the flimsiest of pretexts, had invaded Greece in spite of the latter country's most strenuous efforts at neutrality, and drew therefrom the conclusion that neutrality did not offer any protection. Under these circumstances, Ismet Inönü stressed the solid and unbreakable bonds of alliance uniting his country with Great Britain. Turkish newspapers were frankly outspoken in their violent criticism of the fascist powers and in their sympathy for Great Britain and Greece. Though Turkey maintained formally its neutrality, it left no doubt that any threat to Greece from the rear, from Bulgaria or by a German army advancing through Bulgaria, might find Turkey ready to join the war. It was probably this Turkish stand which influenced Bulgaria not to join the axis in Nov. 1940, when its signature to the Berlin-Rome-Tokyo alliance had been expected. The approaching winter seemed to lessen the danger of immediate warfare in the

TURKISH PLATOON on manoeuvres in 1940. On Oct. 11 an official broadcast from Ankara warned Germany that an Axis invasion would be met by "2,000,000 bayonets"

Balkans, and the Greek victories over the Italians heartened and reassured the Turks, but at the same time they evoked fears of Germany's coming to the help of its defeated axis partner and trying to relieve the pressure upon Italy in Albania by an attack on Greece through Bulgaria. Under these circumstances Turkey entered the year 1941 in a state of pre-war preparedness, confident in the quality and courage of its army and in the support of its British ally.

Turpin, Ben (1869–1940), U.S. comedian, was born in New Orleans, La., son of a confectionery store owner of French descent. His family moved to New York city when he was 7 years old. In his late 'teens his father gave him \$100 and told him to start out for himself, but he lost it gambling the next day and, afraid to go home, went to Chicago. He could cross his eyes and found that he could amuse people with his antics. He decided to go on the stage and with a partner wrote a comedy skit which was successful in vaudeville. Turpin later was employed by Sam T. Jack and in the course of time he created the character of "Happy Hooligan," which he played for 17 years. He went to Hollywood and met Charlie Chaplin, who gave him a job in slapstick comedy. He played in the silent pictures with Mabel Normand, Roscoe Arbuckle and others. He died in Hollywood, July 1.

Tweedsmuir, FIRST BARON, OF ELSFIELD, (1875–1940), governor general of Canada, was born John Buchan in Perth, Scotland, Aug. 26. He was educated at Glasgow university and Brasenose college, Oxford, and after graduation was admitted to the bar. When he was appointed governor general and raised to the peerage in 1935 he was one of the best known men of letters in Great Britain with 40 or 50 books to his credit

including novels and histories. He died in Montreal, Feb. 11, where he had been taken for an operation after suffering a stroke in Ottawa. See *Encyclopædia Britannica*, vol. 4, p. 310.

Unemployment. The various nations in their reports to the International Labour office, as of Dec. 1939, reported better employment in 1939 than in 1938. Throughout the world the picture improved, particularly from the late spring of 1939 through the balance of the year. Preparations for war contributed appreciably to the acceleration of industrial activity both in Europe and in the countries which ship raw materials to Europe. The U.S. business recession of 1937–38 did not affect the rest of the world seriously in 1938. The 21% decline in manufacturing employment in the United States between the summer of 1937 and that of 1938 produced no counterpart in any other nation.

The improvement during the first two-thirds of 1939, as compared with 1938, was not large. The later months of the year, after war broke out, produced more rapid advances in employment. Germany (including Austria), Japan, Great Britain, France, Denmark, Norway, Switzerland and Yugoslavia, particularly, felt the "war boom" by early summer.

The unemployment statistics of many nations are distinctly unsatisfactory and conclusions drawn from them are open to suspicion. The available figures are of two principal kinds, each gathered in several different ways: statistics of employment; *i.e.*, of the number of people at work, and statistics of the number of people in need of work. Employment statistics are derived from "establishment" reports collected by mail or through field agents or labour inspectors. Unemployment statistics are furnished by the employment exchanges (applications for work), unemployment insurance systems (applications for benefits), unemployment relief records, reports of trade union secretaries and censuses of unemployment.

The various types of statistics agree reasonably well in their picture of what happened in the different countries, but not always upon the extent of the changes which occurred.

Great Britain and Northern Ireland have three-fourths or more of their wage earners (about 13,000,000) under unemployment insurance. Of these, 1,831,372 were wholly or temporarily out of work in Dec. 1938. In Dec. 1939 the number was 1,361,525 and then gradually declined to 880,822 by May 1940. By the middle of 1940 the war had reduced unemployment in Great Britain. The average number unemployed (wholly and by temporary stoppages) was 2,744,789 in 1932; 1,790,681 in 1938; 1,513,560 in 1939 and 1,199,545 during the first five months of 1940. These figures included only those insured, who were required by law to register at the employment exchanges. If the 4,750,000 not covered by the insurance act were included in the figures, the unemployment percentage would be more apt to fall than to increase, since military service, the police, civil service, teaching and other relatively stable occupations were in this group.

Registrations of unemployed persons at the employment offices

"IS THE CREATOR BEGINNING TO THINK?" asks Bishop of the St. Louis *Star-Times* in pondering the statistics of U.S. technological unemployment in 1940

of the Irish Free State increased fivefold from the pre-depression years to 1935. From January through April 1939 approximately 105,000 were registered each month; thereafter the registrants decreased rapidly to approximately 70,000 in the summer. Then the number of applicants rose considerably. It was 118,000 in Nov. 1939 and was close to that figure until Feb. 1940, when it began to decline. It was 83,000 in May 1940.

Unemployment remained at high levels in France during the first half of 1939. It had reached its peak in 1935–36. The decline during 1937 was small. Conditions got worse in 1938. The year 1939 began with unemployment nearly as bad as in 1935. But by August a third of the unemployed were back to work. The employment exchanges had 460,816 registered in January and 333,150 in August. In March 1940 the figure was 223,732.

The high unemployment figures which had obtained in the Netherlands since 1933 continued until March 1939. The winter of 1938–39 was very bad. From April improvement was rapid. There were 405,927 registered at the employment exchanges in Jan. 1939 and 297,874 in Jan. 1940. The percentage drawing unemployment insurance benefits decreased from 31.3% in Jan. 1939 to 19.3% in March 1940.

Belgium experienced marked improvement in 1937, but with worse conditions in 1938. The average number unemployed increased from 125,929 in 1937 to 195,211 in 1939. It was 163,598 in March 1940. Unemployment continued at high levels in Belgium during 1939 and early 1940. The figure was 241,336 in Jan. 1940. In 1931, by contrast, it was 110,000. In 1937 the insured workers of Belgium lost 13.1% of their possible working time; in 1938, 17.6%; in 1939, 18.8%; Jan. 1940, 20.5%.

Denmark, Norway and Sweden all experienced moderate improvement during the first eight months of 1939 following slightly worse unemployment in 1938 than in 1937. Denmark's percentage of trade unionists unemployed was 21.4% for 1938 and 18.4% for 1939. It was 32.9% in Feb. 1940; 20.3% in May and 16.3% in July. Norway's in 1938 was 22%; in 1939, 18.3% and Jan. 1940, 23.9%; Sweden's in 1938, 11.8% and in 1939, 10.0%. In Jan. 1940 it was 14.2% and dropped to 9.0% by June. In the summer of 1939 the Swedish figures approximated pre-depression

levels, averaging 6.5%, but in Denmark the summer average was 11.1% and Norway 13.5%.

The German census of 1933 recorded 32,300,000 people in the employable population, of whom 5,900,000 were unemployed. The average number of applicants at employment exchanges dropped from 912,312 in 1937 to an average of 284,132 in the first nine months of 1939. No 1940 figures were available. The percentage of the insured population idle reached minimum figures in 1939. After January, when it was 1.5%, it dropped steadily to .2% in June and was below 5% all summer. This is below what is ordinarily considered "zero employment."

Switzerland's employment exchange figures are unusually reliable measures of unemployment because both the relief act of 1919 and the unemployment insurance law require applicants to register at the employment exchanges. From 1927 to 1929, 2.2% of the employable population were wholly unemployed and 1.6% partially. For practical purposes, this is zero unemployment in any country. In 1929 an average of 8,131 applicants registered at the employment offices (out of about 2,000,000 employables). In 1939 the average was 40,324. Month by month the registrations declined to a low of 23,670 in November. During the first seven months of 1940 the numbers unemployed were as low as in 1929—13,447 in March; 7,226 in May; 12,795 in July.

The Italian index of employment (1929=100) was down to 78.5 in 1932 and back to 94.9 in 1936; 104.5 in 1937 and 110.7 in 1938. The index for 1939 continued to move upward as a result of European wars. Taking into account the growth of population, these figures indicate employment in the reporting establishments approximating the 1929 level in the early summer of 1937. Statistics for Italy during 1940 were not available.

Czechoslovakia had very low unemployment in 1939. There were no figures for 1940. Applications at the employment exchanges averaged approximately 12,000 per month during the first half of 1939. The German seizure of the country made the figures for 1939 and 1940, if obtainable, non-comparable with earlier figures. Therefore no comparisons with earlier years are attempted.

Yugoslavian employment exchange statistics record an average of 22,517 registrants for work in 1938; 24,223 in 1939. Unemployment increased in the winter of 1939-40. There were 36,896 registered in Jan. 1940; 44,844 in February. The figures moved down to 19,058 in June.

The only Mexican figures on unemployment are "official estimates." The figure given for 1930 was 75,695; 1932, 339,378; 1938, 204,702; and the last six months of 1939, 177,223.

The general trend of employment in the United States and Canada was downward in the first half of 1938, with severe unemployment, particularly in the United States, until the spring of 1939. There was then steady improvement the balance of the year.

The Canadian employment index (1926=100) averaged 111.8 for 1938 and 113.9 for 1939. The index was at 108.1 in Jan. 1939 and rose to 122.7 in Dec. 1939. It rose steadily during the first ten months of 1940 to 136.2 in October. The employment exchanges carried average registrations of 103,739 during 1939 and 109,400 the first nine months of 1940. Estimated unemployment decreased from 352,000 in July 1939 to 238,000 in July 1940.

The United States took a special census of unemployment, Nov.

20, 1937, which recorded 7,822,912 as unemployed (2,001,877 of whom were employed on government relief work). This census was a voluntary report of individual citizens on forms left at all homes by the postal service. Sample tests made on 1,455 mail routes indicated that a 100% return might have shown as many as 10,800,000 idle on November 20. A half million workers were laid off in Nov.-Dec. 1937. Comparing these figures with the 13,500,000 to 14,500,000 idle in 1932-33, the 1937 unemployment figure was discouragingly large.

Previous to 1930 the United States economic system expanded each decade rapidly enough to absorb the growth of population. During the '30s economic growth failed to keep pace with the growth of labour supply. The unemployment of 1937 was in considerable measure due to this factor.

The factory employment index of the U.S. stood in the census month (Nov. 1937) at 104.1 (1923-25 base). A year later it was 93.3 and from Jan. to Aug. 1939 ranged between 92.2 and 96.4. The low point for the '30s was in 1932, 66.3. The index rose rapidly after July 1940.

Pay rolls always fluctuate more violently than employment because of overtime and part-time work. The monthly average of pay rolls (1923-25=100) was 110.4 in 1929; but 46.7 in 1932; 85.6 in 1936; 102.0 in 1937; 77.5 in 1938; 90.8 in 1939 and 100.8 the first ten months of 1940.

There were employed on public work financed by other than "regular" appropriations in the United States, approximately 3,423,000 people in June 1938. This was the highest monthly figure for work relief down to the end of 1940. There were 2,671,462 in Sept. 1939. The Sept. 1940 figure was 2,619,000. Late in 1940 declines began.

While employment exchange statistics are available for the U.S., the figures have been so profoundly influenced by relief, public works and other governmental policies that they cannot be used in comparisons with other nations.

Japan was one of the nations with high employment in 1937, a by-product, of course, of war. Their employment index (1929=100) was 128.8 in 1937, and 141.8 in 1938. In 1939 it rose to 158.0 in June. The government's official estimates of unemployment in 1932 estimated that but 6.8% of their employable population was idle, a figure hard to reconcile with an employment index of 82 that year. For Jan. 1939, their unemployment estimate was 212,254. The estimates were about 60,000 lower during 1939 than for the corresponding months of 1937. Japanese unemployment was low, 1937-39. No figures were available for 1940.

New Zealand's are entirely employment exchange figures. They indicate a gradual improvement in employment after 1934, with 1937-38 distinctly better than any year since 1933. The numbers registered ranged between 1,000 and 9,000, Jan. to Dec.

1939. These are extremely low figures, corresponding to those of 1928-30.

The only unemployment figures for Australia are compiled from reports sent in by union secretaries—a not very satisfactory type of unemployment statistics. The Australian trade union returns showed 31,000 or 7% of the union workers unemployed (monthly average) in 1927; a figure which grew steadily to 120,454 (29%) in 1932 and then gradually subsided to 53,992 (12.2%) in 1936. The figures averaged 41,823 in 1937; 40,526 in 1938; and 47,033 in 1939. The figure for Feb. 1940 was 38,830.

The employment exchange registrations in Chile jumped from an average of 29,345 in 1931 to 107,295 in 1932, and then gradually dropped to 30,055 in 1934. Since then, applications for work have been at low levels. Registrations averaged only 10,672 per month in 1935; 6,474 in 1936; 3,215 in 1937; 4,578 in 1938; and from 7,600 to 11,200 in 1939 and to April 1940. Unfederated Malay States, area 24,728 sq.mi., population (1931) 1,600,895, is one of the three principal subdivisions of British Malaya (see articles, STRAITS SETTLEMENTS and FEDERATED MALAY STATES). They consist of five land states: Johore, Kedah, Perlis, Kelantan and Trengganu, and of Brunei, which is on the island of Borneo. The states are ruled by native sultans who have treaty relations with the British crown under which British advisers are appointed for the general supervision of administration. The area and population of the various land states are (1938) as follows: Johore 7,330 sq.mi., population 709,870; Trengganu 5,050 sq.mi., pop. 201,370; Kedah 3,660 sq.mi., pop. 481,242; Kelantan 5,750 sq.mi., pop. 399,299; Perlis 310 sq.mi., pop. 55,446. There are Japanese iron concessions in Johore, which is opposite Singapore, and in Trengganu. Rubber is the chief product of the states; they also produce a surplus of rice and copra.

Union of Soviet Socialist Republics.

Area, Aug. 1940: c. 8,350,000 sq.mi. (Aug. 1939: 8,175,500 sq.mi.), over one-fifth of which lies within the Polar circle; population, including that of the new territories incorporated in the U.S.S.R. since Sept. 1939, but exclusive of the natural growth of the population of the soviet union in 1939 and 1940, was given by M. Molotov on Aug. 1, 1940 as 193,000,000. The general increase in the population of the U.S.S.R. for the period of 12 years to Jan. 1939 amounted to 23,439,271, or 15.9%, the rate of increase varying throughout the period (see below: 1939 Census). Sixty-four per cent of the population of the soviet union lives in the Russian Soviet Federated Socialist Republic (78% of the U.S.S.R. territory), and the remaining 36% of the population is distributed almost in equal halves between the Ukrainian S.S.R. (2% of the territory) and the nine other union republics (total territory, 20%). In Jan. 1939, Great Russians constituted 58.4% of the population (as against 53% at the end of 1926); Ukrainians, 16.6% (21.2%); White Russians, 3.1% (3.2%); Uzbeks, 2.9% (2.7%); Kazaks, 1.8% (2.7%); Tatars, 2.5% (2%); Jews, 1.8% (1.8%); Azerbaidzhanis, 1.3% (1.2%); Georgians, 1.3% (1.2%); Armenians, 1.3% (1.1%). Altogether some 60 different ethnic groups are comprised in the union. The 140-odd languages and dialects spoken in the U.S.S.R. belong to the following

groups: Indo-European, Caucasian, Semitic, Ural-Altaic (Finnic-Ugrian, Samoyede, Turkic, Mongolic, Tungusic), Palaeo-Asiatic and Far Eastern. Eleven cities have a population of over 500,000: Moscow, 4,137,018; Leningrad, 3,191,304; Kiev, 846,293; Khar'kov, 833,432; Baku, 809,347; Gor'ki, 644,116; Odessa, 604,223; Tashkent, 585,005; Tiflis, 519,175; Rostov-on-Don, 510,253; Dnepropetrovsk, 500,253.

History.—With the beginning of 1940 the Russo-Finnish war entered on its second, inconclusive, month. The Finns were exploiting every strategic resource of their territory. The red army was checked alike in the sparsely populated north and on the strongly fortified Karelian isthmus: everywhere save in the Petsamo region. The difficulties of a winter campaign, and, in particular, the valour, equipment and fortifications of the Finns, had evidently been underrated by the soviet authorities. Not till February did they establish a superiority in numbers and artillery, as well as in aviation, which enabled them to effect a break-through on the isthmus, leading to the peace treaty (signed March 12, 1940) which transferred to Russia c. 16,175 sq.mi. of Finnish land and lakes with less than half of the original population estimated at 450,000. The new frontier runs from west of Viipuri (90 mi. from Leningrad as against the 20 mi. distance fixed in 1920) along a line roughly coinciding with that laid down at the Peace of Nystad between Peter the Great and Sweden (1721). In the north the region of Kuolajärvi and the Fisherman's and Middle peninsulas were ceded to the U.S.S.R., together with transit rights to Norway and to Sweden. Moreover, the U.S.S.R. obtained a 30 years' lease of the Hangö peninsula. These peace terms considerably restricted Finland's ability to resist Russia in case of future misunderstandings or further demands; but though much heavier than the original terms, they were yet lighter than those canvassed by the U.S.S.R. at the outset of the war. These gains cost Russia in casualties 49,000 killed and 159,000 wounded, according to the Russian general staff; General Mannerheim estimated 200,000 Russians killed or frozen to death.

The violation by the U.S.S.R. of the Soviet-Finnish non-aggression pact evoked vehement protests throughout western Europe and the U.S.A.; even from circles where sympathy with the soviet regime extended to justifying soviet policy between August and Oct. 1939. It exposed the union to a near-rupture of diplomatic relations with, and to the threat of armed intervention by England and France, after the League of Nations had excluded the U.S.S.R. from membership and called for help for the victim of aggression (Dec. 14, 1939). These protests and threats the soviet government met with the defence that its policy was serving, not imperialist ambitions, but the security of the union; and with violent attacks on the "capitalist democracies." The soviet-German trade agreement of Feb. 11, 1940, with its considerable economic concessions to Germany, may be partly explained as a reaction to the same factors.

The German occupation of Denmark and Norway and the further success of German arms in the Low Countries and France conduced not only to revise western views of the positive part the soviet union might play in this war, but also to quicken soviet realization of the pitfalls in a continuation of friendly neutrality towards Germany. Within a brief few weeks the seemingly impossible became reality: Sir Stafford Cripps was appointed envoy extraordinary to the Kremlin, while soviet press, radio and official pronouncements were gently but firmly defining soviet foreign policy as one of strict neutrality, and "arming to the teeth" as the basic aim of all soviet domestic planning and activities. Decree followed decree, aiming to perfect the country's preparedness and efficiency—both military and economic—in case of war. The red army sacrificed its most cherished privileges of

communistic self-government: a decree of May 7 abolished the army Komsomol discussion clubs and the right of debating the character and conduct of superiors, restricted the powers of the political commissars, while increasing those of the professional officers, and established strict rules of deference to superiors.

Developments in the west probably contributed also to intensify soviet pressure on the Baltic states. Alleging that the non-aggression pacts binding these states to the U.S.S.R. were being stultified by intrigues of the leading groups in the three states, the Kremlin demanded in the middle of June a change in the composition of the Baltic governments and the right to reinforce its garrisons in the Baltic countries. A month later, following elections on a fresh electoral basis, the parliaments of these states unanimously adopted a soviet constitution and requested to be incorporated in the soviet union.

On June 26 Molotov addressed to Rumania a demand for the settlement of soviet-Rumanian disagreements. Rumania was to agree within 24 hours to the retrocession of Bessarabia and the cession of northern Bukovina, "the great majority of whose inhabitants are bound to the soviet Ukraine by a common history, common language and common nationality." Failing to obtain a respite for discussions, the Rumanian government agreed to surrender the two provinces within four days (June 28-July 1).

Between Aug. 1 and 6 the Baltic republics, as well as the Karelian and Moldavian, were by the supreme soviet unanimously admitted to the Union of Soviet Socialist Republics, the number of which was thus increased from 11 to 16. The territorial gains of the U.S.S.R. in the ten months from Sept. 1939 to July 1940 amount to c. 174,500 sq.mi. (roughly double the area of Britain), with a total population, according to soviet data, above 23,000,000; of whom "nineteen-twentieths previously formed part of the population of the U.S.S.R." The totals are composed as follows: western White Russia and western Ukraine—c. 75,000 sq.mi., with over 13,000,000 inhabitants; ceded Finnish territory, c. 16,175 sq.mi., with perhaps 200,000 inhabitants; the Baltic states, 63,847 sq.mi., with 6,000,000 inhabitants; Bessarabia, 17,177 sq.mi., with 3,200,000 inhabitants; northern Bukovina, 2,316 sq.mi., with a population of over 500,000. The economic importance of these accretions is of course overshadowed by their strategic significance.

In the course of 1940 the U.S.S.R. signed new trade agreements with Iran, Afghanistan, Sweden, Hungary, Finland, Bulgaria, Yugoslavia (which had only just accorded diplomatic recognition) and Germany. The contents of the soviet-German pact have not been disclosed. References in the press of the two countries have revealed no more than that "the trade turnover between the contracting parties is intended to surpass the record turnover of the year 1931," when it amounted to r.m. 1,066,000,000 according to German, and to Rbls. 2,365,000,000 according to soviet statistics.

The possibility of improving Anglo-Russian relations and concluding a trade pact was examined in conversations begun in the second half of March 1940 between representatives of Britain and Russia. On April 19 and May 8 the British government inquired whether the soviet government was prepared: (1) to disclose the provisions of the soviet-German trade agreement, and (2) to guarantee that goods imported into the soviet union would not be re-exported to Germany. The soviet government (on April 29 and May 20) negatived the former query, insisting on the right of neutral states to trade freely according to their own economic requirements; but, regarding the second, agreed to guarantee in general terms that imports from Britain would not be re-exported. The conversations, however, made little progress, being further complicated by questions touching the cancellation of soviet orders in Britain; the release of ships detained by Britain; and the closing of the Burma road without prior notice to the

U.S.S.R.; but, above all, from July on, by the question of British recognition of soviet absorption of the Baltic states with all the consequences thence issuing. On Oct. 22 Sir Stafford Cripps informed the soviet government that the British government—in return for neutrality and for an undertaking to conduct no anti-British propaganda—were prepared to give *de facto* recognition to the inclusion of the Baltic states within soviet frontiers, *de jure* recognition to be determined at the next peace conference, in which the soviet union is to participate as an equal partner; they were also prepared to offer an assurance that Great Britain would not join a bloc hostile to the soviet union. U.S.-Russian, like Anglo-Russian, conversations made but little progress: no agreement was reached relative to the removal of the embargo, imposed during the Finnish war, on aviation equipment and machine tools, or to the release by the U.S.A. of shipping and funds belonging to the Baltic states. Nevertheless, on the expiry of the soviet-U.S. trade agreement (on Aug. 7), it was mutually prolonged for a further year. At the end of November further conversations, characterized by Sumner Welles as "friendly and concretely constructive," were in progress. Soviet relations with Japan assumed—despite continued soviet help to China, which, however, became both less patent and less extensive in scale—a more normal complexion, and on June 9 an agreement was reached concerning the exact demarcation of the frontier in the Kharlikingol river area.

The Berlin-Rome-Tokyo pact of Sept. 27 might in certain circumstances be turned against the U.S.S.R. At the same time the current extension of German-Italian influence in the Balkans raised in a new form a problem of orientation for the foreign policies alike of the soviet union and of Britain and the U.S.A. The attitude of the union to the Balkan question, and in particular to Turkey, remained to be clarified, as did the extent of soviet-German agreement and its duration. In attempting to evaluate the policy of the union, it is essential to bear in mind that the tragic balance sheet of the War of 1914-18 is ever present in Russian memory, for that war and the ensuing "settlements" cost Russia 5,500,000 dead and wounded, and 333,000 sq.mi. of territory, with 30,000,000 inhabitants, of whom a substantial proportion were Russians.

Economic Planning.—*Third Five-Year Plan, 1937-42.*—Full details of the plan are still lacking and information on estimates and results for 1939 and 1940 is incomplete. To capital construction 192 milliard roubles are to be devoted, of which 112 milliards are allotted to industry, primarily heavy industry (94 milliards to be invested in capital goods production and 18 milliards in production of consumers' goods). The scope of industrial construction projected may be judged by the following percentage increases postulated for the end of the five-year period in 1942: total industrial output, 136% (the corresponding figure was 92% for the first, 114% for the second five-year plan); oil, 77% (85% and 111%); steel, 58% (162% and 189%); coal, 90% (112% and 137%); chemical industry, 137%; machine-building, 129%; and electric power, 106%. The productivity of labour is to increase by 65%; the manufacturing costs are to be lowered by 10%; and improvement in the quality of goods is to be attained in all branches of industry.

In agriculture the increases aimed at are: for gross agricultural yield, 52%; grain, 27%; cotton, 28%; sugar-beets, 29%; for livestock, the rates vary from 35% (horses) to 110% (sheep and goats). The number of tractor plows is to reach a total of 550,000; sowing is to be mechanized up to 80% and harvesting of grain up to 75%.

The railway freight traffic is expected to rise by 44%; 11,000 km. of new line are to be built (the chief item of construction is the Stalin-Magnitogorsk main line), 8,000 km. to be double-

SOME BESSARABIANS CHEERED and some looked on glumly as red troops entered the city of Kishinev July 3, 1940, to occupy territory ceded by Rumania to the U.S.S.R. a week before

tracked, 1,840 km. to be electrified. The river and canal traffic is to increase by 76%. One of the most important enterprises envisaged by the plan is the regulation of the depth of the Volga along its whole course by means of a number of dams which are to be constructed on the Volga and Kama. In the Kuibyshev electric power centre a very large reservoir (600 km. by 20 km.) is to be built to irrigate 3,000,000 ha. of land in the Volga region, which is a major granary of the union. The energy of the hydraulic power stations at Kuibyshev, scheduled to generate 3,400,000 kw. by 1952 when all of them are completed, is to be used for the development of industry east of the Volga and also to supply current to other regions, including the Urals. A whole series of new canals is projected, the most considerable of which is a 100 km. link between the rivers Volga and Don at the level of Stalinograd. The aim of the new construction schemes is "to bring industry closer both to its raw materials and to the consumption areas, so as both to rationalize transport problems and to develop the economically backward regions."

Results for 1939. On the basis of data so far published by the State Planning commission (in terms of value, not volume), the economic results in industrial production for the year 1939 can be summarized as follows: total industrial output increased by 14.7% and the productivity of labour by 17%, which percentages are above the yearly averages laid down for the third five-year plan. The greatest increases of production were registered in the defence industries group, comprising the aeroplane, munitions, armaments and the shipbuilding industries, which showed a rise of 46.5%; heavy and medium machine-building industries, 13.7% and 15.1%, respectively; non-ferrous metallurgy, 14.1%; chemical industry, 12.6%; coal industry, 9.2%. Light industry recorded an 8.1% increase; the meat and dairy industry, 14.2%.

In agriculture, too, the year 1939 showed satisfactory results. The grain harvest amounted to 11% more than in 1938 (7.7% above the yearly average for the period 1935-1939); important increases over 1938 were also claimed in the yield of potatoes (60%), sugar-beets (26%), flax (16%), cotton (5%). The second half of the year was, however, marked by a deterioration in the work of the machine-tractor stations, with the result that neither the annual plan for plowing nor the plan for the reduction of the costs of operation was fulfilled; by July 1, 25% of the wheel tractors required major repairs.

Results for 1940. The year 1940—the third in the current five-year plan—is of decisive importance for the realization of the plan as a whole. Information so far available shows that the progress achieved in 1939 continued in 1940, special emphasis being laid, as in the previous year, on the development of heavy industry, and of the defence industries in particular. The expenditure on defence in the state budget was more than double the figure of 1938. Ferrous metallurgy, especially the extraction of ores and fuels—notably oil—continued to lag behind other branches of production, though they were to have led the rest.

Transport as formerly met the growing requirements of the national economy only with the greatest difficulty. The production of consumers' goods, the deficiency of which has been long and acutely felt by the population, yielded precedence to the urgent need of capital goods. In the first four months of 1940 light industry lagged behind schedule.

At the beginning of the year higher quotas of production were introduced and the soviet government called for the realization of five-year objectives in labour productivity in four years. On April 6 a new soviet income-tax statute was promulgated, imposing progressive taxation on incomes in excess of 150 roubles per month (average wage, c. 275 roubles per month). The tax, payable monthly, covers basic wages, payments for overtime and piecework, personal bonuses, premiums, etc. Additional sacrifices "to strengthen still further the national defence of the country" were demanded of the working population in an important decree of June 26, issued by the praesidium of the supreme council. This decree introduced an eight-hour working day, instead of the seven-hour day, in factories, co-operatives and public enterprises for workers and employees over the age of 16, as well as adding a working day to the week, both changes to take place without extra pay (in case of piecework the quotas were to be reduced proportionally to the increase in working hours); unauthorized quitting of enterprises or institutions by workers and employees was prohibited by the decree; those who disobey were to be tried and imprisoned, while shirkers were to be punished with correctional labour for a period up to six months at the place of their employment and deprived of 25% of their wages. On July 10 a decree provided punishment (imprisonment for five to eight years) for negligence in achieving prescribed standards in the production of goods, "a crime against the state equivalent to wrecking." On Oct. 2 a decree of the supreme council ordered the calling up of all youths between the ages of 14 and 17 for work in state factories, mines, transport, etc. They were to be mobilized for four years and the first 600,000 were called up between Nov. 10 and 25, to form a "state labour reserve" to be at the disposal of the Council of People's Commissars.

As in industry, so in agriculture, government ordinances for the year 1940 aimed at achieving maximum production within a minimum of time, while tightening discipline and reducing production costs. The new decrees base the requisite delivery quotas of grain and of a number of other agricultural products on total acreage of farmland and not, as before, on acreage under cultivation, as well as fixing new methods of crop planning on the collective farms. The chief aim of the agricultural plan for 1940 was to raise crop yields. Collective farms had to average 11.2 qu. per hectare of grain, 13.3 qu. of cotton, 3.7 qu. of flax fibre, 200 qu. of sugar-beets and 112 qu. of potatoes. The area under grain was to remain practically the same as in 1939. The area under industrial crops was to increase to 10,613,000 ha., 116,000 ha. more than in 1939. The area under feed crops was to be 14,618,000 ha., a 4,412,000 ha. increase over 1939. A large increase in livestock is estimated for 1940. The use of fertilizers

was to be extended, special care was to be given to storing, cleaning and testing of seed, and essential attention was to be given to the timely repair of tractors.

To sum up, one may affirm that, despite a series of important shortcomings both in planning and in production, especially on the qualitative side of production—references to which abound in soviet periodicals—the fundamental aims of the plan, above all its military aims, were in 1940 being rapidly and intensively pursued. With the completion of the third year of the plan undisturbed by any major shock of war, it should be considered that the third plan had on the whole struck solid roots in reality, and that along a considerable number of lines of the national economy the significance of what has been achieved undoubtedly exceeded three-fifths of the five-year program. Government measures in 1940 would result in a further increase of production (the decree of June 26 alone should achieve an increase of one-sixth and is equivalent to the recruitment of 2,000,000 more workers), but it may be doubted whether they would succeed in balancing the execution of the plan as a whole, or help to eliminate the anomalies of development, inherited from the previous ten years, which the third five-year plan was designed in great part to correct.

1939 Census.—The latest census, the findings of which have not yet been completely systematized, showed an increase in population from 147,027,915 on Dec. 17, 1926 to 170,467,186 on Jan. 17, 1939; *i.e.*, an increase of 15.9% during this period of 12 years, one month. This growth is a very considerable one, if compared, *e.g.*, with that of the population of the rest of Europe, which soviet statisticians assess at not more than 8.7% for the same period. The yearly average for the period (1.36%) does not accurately indicate the rate of growth of the soviet population, inasmuch as this rate was by no means constant during these years. If in the first six years the population increased, as indicated by soviet figures issued in 1932-33, by 18,700,000, the increase in the following six years can have amounted to no more than 4,700,000. This fall in the rate of increase derives primarily from the years 1933 and 1934, appearing as a result on the one hand of the twin burdens of the five-year plan and collectivization, and on the other hand of the famine prevailing in those years. The second five-year plan (1932-37) was based on the assumption that the population of the union would have grown by the end of 1937 to 180,700,000; the rural population was to have reached 134,600,000 at such time, whereas the 1939 census figures assign to it only 114,500,000.

The vast increase of the urban population throughout the union is clearly apparent in the Table II on page 681, which shows a more than twofold increase during these 12 years, until in 1940 the urban population amounted to little less than

one-third of the total population (1897, 11.5%; 1926, 17.9%; 1939, 32.9%).

The population of Moscow doubled itself in 12 years; and that of the other ten cities numbering over 500,000 inhabitants increased one and one-half to three times. Thirty-four towns of the union showed in the same period a population increase varying from three to ten times; the population of Prokopyevsk, Dzerzhinsk, Murmansk, Stalinabad and Stalinsk increased by more than ten times; Komsomolsk, Stalinogorsk, Magnitogorsk and Karaganda, totalling 459,000 inhabitants, are new towns, built in the period between 1926 and 1939.

The population of the U.S.S.R. is unevenly distributed between its constituent regions. Whereas the average density is eight inhabitants per sq.km., both the northern zones of the tundra and targa and the southern deserts of Kazakhstan and the central Asiatic republics average less than one person to the sq.km. Over the rest of the soviet territory the average density of population slightly exceeds that of the U.S.A. The 1939 census showed that 94% of the total population was concentrated within one-third of the area—while nearly half the population occupied only one-seventeenth of the area. The census showed a displacement of population (1) to the Urals, Siberia and the far east, which received in these 12 years more than 3,000,000 migrants and increased in population by 33%, and (2) to the Uzbek, Tadzhik, Turkmen and Kirghiz S.R., which absorbed 1,700,000 migrants and increased in population by 38%. Eastward, to Asiatic Russia, is also moving the large-scale industry, which is rapidly being built up in the Asiatic parts, with capital accumulated in, and skilled labour forthcoming from, the European parts of the union.

According to age groups the population was distributed as fol-

Unitarian Church. The outstanding event of the year in Unitarian churches of the U.S. was the work of the Unitarian Service committee. It grew out of the experience of the Commission for Service in Czechoslovakia, 1938–39. In Jan. 1940, the Unitarian association sent its director of foreign relations, Dr. Robert C. Dexter, and his wife, Dr. Elisabeth A. Dexter, to Europe to discover opportunities for service. As a result of their visit, the association organized the Unitarian Service committee under the chairmanship of Dr. William Emerson of Boston, for the purpose of providing assistance at home and abroad to those in need. It was planned to

undertake the first venture with Czechoslovakian citizens in France, and Rev. and Mrs. Waitstill H. Sharp, who had worked in Czechoslovakia, again volunteered.

Because of the collapse of France they were obliged to make their headquarters in Lisbon, dealing with the 10,000 refugees there, where, except for the Joint Distribution committee, they were the only American representatives. Later they were able to get into unoccupied France and were active in the alleviation of the conditions of refugees. They were able to bring to the U.S. and to send to other countries, particularly Great Britain, hundreds of Czechs, French, Belgians and Germans who were suffering because of religious or political convictions or racial connection, many among the most prominent literary and political figures of Europe. Mr. Sharp returned to the U.S. in the fall, and was succeeded by Dr. Charles R. Joy. In November Mrs. Sharp brought to the U.S. the first group of children out of France. The committee has had the co-operation of the United States committee for the care of European children.

The second occupant of the new office of moderator of the denomination is the distinguished educator and president of Mills college, California, Dr. Aurelia Henry Reinhardt, who was elected in May.

United Kingdom: see GREAT BRITAIN AND NORTHERN IRELAND UNITED KINGDOM OF.

United States. The population of the United States in 1940, as determined by the decennial federal census, was 131,669,275, not including possessions. This figure represents an increase of 8,894,229 over the census of 1930. With possessions included, the population was 150,621,231. The area of continental U.S.A. is 3,026,789 sq.mi. For population figures of the individual states, see the articles on the separate states. See also the articles BIRTH STATISTICS; CHURCH MEMBERSHIP; DEATH STATISTICS; EDUCATION; ILLITERACY; INDIANS, AMERICAN; NEGROES (AMERICAN); UNIVERSITIES AND COLLEGES, etc., for statistical information of social conditions. (X.)

History.—The year 1940 was the most critical year in U.S. history since President Roosevelt's accession to power in 1933. It was faced by two major problems, not unrelated to each other. First, the people of the country were called upon, in the presidential year, to decide whether they should continue the party of the New Deal in office and should break the tradition of a century and a half by electing Mr. Roosevelt for a third term, or should entrust the government to the Republicans, who, while supporting many of the policies of the past seven years, yet criticized sharply the methods by which these policies had been carried out and condemned the administration on the score of its augmentation of the national debt, its alleged use of federal re-

lief funds to secure political support, its obstruction of industrial recovery by measures of undue severity against private business and its encouragement of class spirit. Playing a major part in this party rivalry and creating an unprecedented anxiety and confusion among the American people, was the foreign situation, which grew more critical with each passing month. Herr Hitler's assurances at Munich, in Sept. 1938, that his aims would be fulfilled with the incorporation into the fatherland of the Germans lying outside the third reich, had already been broken by his destruction of Czechoslovakia, his seizure of Danzig and his invasion and annihilation of Poland. His purpose to force the nazi regime on Europe, and perhaps the whole world, stood clearly revealed and boastfully confessed. The year 1940 demonstrated the overwhelming superiority of Hitler in planes, tanks and submarines. The year closed with the fate of Britain hanging in the balance and the people of the United States divided between the determination to keep the United States out of the war and the apprehension lest the nazis, victorious over Britain, should proceed to the assault on the democracies of the western hemisphere. (See *Foreign Relations*.)

In the early months of 1940 there was a slight recession in business, but in the spring the foreign demands for U.S. iron, steel, cotton, aircraft and industrial machinery initiated a war boom which brought the business index higher than that of 1929, and provided work for about 3,000,000 men. Corporation reports at the end of the year showed profits generally comparable to those of the previous year, though the payments of extra dividends in the closing weeks were less generous than in 1939, on account of the alteration in the tax laws on undistributed profits.

The 16th decennial census, compiled by the director, William L. Austin, showed a population of 131,669,275 for the continental United States, with an additional 2,595,956 for Alaska, Puerto Rico, Hawaii and other outlying territories and dependencies, exclusive of the estimated 16,356,000 inhabitants of the Philippines. Three distinct trends are noticeable in the first of these figures as

compared with the census of a decade ago. First, the rate of increase in the 48 states since 1930 has been only 7.2%, as compared with 16.1% for 1920-30. The 1940 rate is the lowest in all the decades since the first census was taken in 1790 (the average increase being about 25%), and this low rate may be attributed to a combination of causes, prominent among which have been declining immigration and the serious economic depression of the 1930s. To say that the U.S. population is tending to become stationary because the land is "filling up" seems almost ridiculous when it is remembered that the density of population in the United States is only about 44 to the square mile, as against more than ten times that number in Great Britain. The second fact revealed by the census of 1940 is the slowing up of the growth of the cities, as compared with suburban developments encouraged largely by the convenience of the automobile for residence in the suburbs. The rate of increase in the 237 cities of more than 25,000 inhabitants was only 5.2%, compared with 23% in the previous decade. The five leading cities (New York, Chicago, Philadelphia, Detroit, Los Angeles) still held their respective rank, but only in New York was the gain (from 6,930,446 to 7,454,995) impressive. Chicago gained 20,370 in the decade, and Philadelphia lost population, as did Cleveland, St. Louis and Boston. Pittsburgh and San Francisco gained. In the third place, the census showed an increase of people over 45 years of age, from 22% of the total population in 1930 to 30% in 1940, with nearly 2,000,000 fewer children under the age of ten; a trend which, if continued, will have serious effects upon educational, economic and social security programs. A sinister fact has been the increasing migratory population from farms, mines and lumber camps. About 350,000 families, or 2,000,000 persons are on the move every year, and at one time 4,000 vagrants were said to be passing through Chicago every day. On the other hand, an encouraging fact is the decline of illiteracy to a point which made it seem advisable to omit the literacy test from the 1940 census. It is estimated that since 1935 agencies like the WPA and the CCC have taught 1,250,000 persons to read and write. (See also CENSUS, 1940.)

The wealth and resources of the United States are enormous.

AS THEY DELIVERED the first of 50 over-age U.S. destroyers to the British fleet under the deal announced Sept. 3, 1940, American sailors demonstrated the fine points of the guns to the British crews in Canada

Occupying only 6.5% of the world's surface, it had in 1940 45% of the world's wealth, 70% of its gold reserves, 62% of its oil, 50% of its cotton, 33% of its steel, copper and coal. The United States built 2,000,000 more automobiles and trucks than all the rest of the world combined, and had more than half the world's telephones. The estimated national income for 1940 is \$68,500,000,000, an increase of some \$4,500,000,000 over that of the previous year, but still far below the figures of the pre-depression years or the \$80,000,000,000 set by the president as the attainable goal.

Congress.—The second session of the 76th congress (senate 73 Dem., 23 Rep.; house 262 Dem., 169 Rep.) convened on Jan. 3, 1940, and sat through the entire year of 366 days—a record unequalled in United States history. Despite the fact that it was an election year, when congressmen and senators are usually intent on repairing their political fences, and that the president favoured an adjournment, promising to call congress back to Washington in case of an emergency, the members felt that the foreign situation was so precarious that they could not leave the capital. The president's message took note of the European war, which had been declared four months before, but which up to the beginning of 1940 had seen no aggressive movement on the part either of the nazis or of the Allies—a sitzkrieg rather than the expected blitzkrieg. The war, when it began in earnest, would doubtless affect the political and economic policies of the United States, and the United States might be expected to participate in the peace which would follow. No further domestic reforms were proposed by the president. The renewal for a third three-year period of the authorization of Secretary Hull's reciprocity pacts was recommended. As the spring and early summer brought rapid nazi victories, the question of U.S. defence preparedness occupied the attention of congress more and more. (See *National Defence* below.)

Apart from defence measures, the legislation of the year was not very impressive. A second Hatch bill was passed in July, extending the provisions of the Hatch bill of 1939 (which prohibited employees of federal agencies from participating in electioneering activities) to state and local agencies, like relief, social security, highways and schools, which derived part of their support from federal funds, and limited to \$3,000,000 the amount which any party might spend in a campaign and to \$5,000 the contribution of any individual or corporation to the same. The Ramspeck bill, bringing into the classified civil service large numbers of the 400,000 out of the 1,000,000 government employees not already under the civil service rules, was passed late in November, after a two years' fight. The Logan-Walter bill, providing that the rules and regulations of the quasi-judicial federal agencies, like the National Labor Relations board, should be subject to review by the courts, was passed by the house in June, and, after a bitter struggle, was approved by the senate on Nov. 26 by the close vote of 27 to 25. It was vetoed by the president on the ground that it would cause immense confusion and delay in the functioning of the boards affected, and the veto message was accompanied by a supporting opinion from Attorney-General Robert Jackson. The house failed of the two-thirds vote (153 to 127) necessary to override the veto, though 39 Democrats voted with the Republicans against the president. The most important piece of unfinished business in domestic legislation when the year closed was the amendment of the National Labor Relations act, consisting of a score of changes which the house committee had recommended in March. (See *NLRB* below.) The debt limit was raised from the \$45,000,000,000 fixed by act of congress in 1916 to \$49,000,000,000.

The Budget.—The president's budget message, which was sent to Congress the day after the regular message, made a gesture in

INDUSTRIAL PRODUCTION in the United States; Federal Reserve Board index, with adjustment for seasonal variation (1935-39=100)

the direction of reducing the deficit, which for 11 years had ranged between \$1,384,000,000 (1938) and \$4,550,000,000 (1936), totalling \$27,356,000,000. The constantly recurring proposals to pare down the relief appropriations, in the hope that revived business would absorb a large number of the unemployed, were as constantly thwarted. The charges for the maintenance of the government and the servicing of the debt were obligatory. Appropriations for the army and the navy increased from year to year. The treasury took in larger receipts, to be sure, but the expenditures more than kept pace with the income. New taxes or further borrowing, or both, seemed the only expedient. President Roosevelt recommended an appropriation of \$975,000,000 for relief for the fiscal year 1940-41, and hoped that the relief rolls might be cut to 1,350,000. But by autumn the rolls still showed over 1,700,000 on relief, and the president had asked that the entire \$975,000,000 be spent in eight months instead of over the year. In his budget measure he had estimated the deficit for the year at \$2,276,000,000; but the tremendous program of national defence entered upon as the possible effects of the European war on the United States and the other nations of the western hemisphere became evident threw into the discard all the budgetary estimates of the beginning of the year. What the cost of U.S. preparedness may be no one could predict. More than \$13,000,000,000, or twice the amount of the estimated receipts of the treasury, were authorized for defence, and that figure may be doubled before the United States is allowed to return to a normal life of peace. To meet this expense only a slight provision in new taxes was made, calculated to yield perhaps \$3,000,000,000 or \$4,000,000,000. On July 1 taxes on amusements and luxuries of various sorts were newly levied or increased, and the income tax base was broadened by the lowering of the exemptions to include about 2,000,000 persons who had never paid an income tax before. A flat 10% addition to all federal income taxes was also enacted.

The Farm Problem.—No major agricultural legislation was passed during the year 1940. The farm income for the year was estimated at \$8,900,000,000, a slight gain over the figure of 1939 and almost double that of 1932 (\$4,600,000,000). The appropriations for benefit payments and farm relief exceeded the \$700,000,000 recommended by the house committee early in the year. The census showed 32,000,000 people, about 25% of the population of the country, living on farms, as compared with 33% in 1910. Farm tenancy, which had reached the alarming proportion of 42%, was a major problem, especially in the south; and propositions were made in congress for loans at 3% to help farmers purchase their own homes, as well as for aid in abolishing rural slums (see *Housing*). The government held about 18,000,000 bales of cotton, taken off the farmers' hands to preserve Secretary Wallace's "ever normal granary" scheme, and in 1940

the Federal Surplus Commodities corporation supplemented the food stamps of 1939 by cotton stamps. A person could buy \$4 worth of these stamps and exchange them for \$8 worth of cotton goods at the stores, and the government would redeem the stamps for cash from the merchants or bankers. Thus the double purpose of reducing the cotton surplus and increasing the buying power of the poorer public would be fulfilled. With wheat at 68.2 cents a bu., corn at 59.4 cents a bu., and cotton at 9.3 cents a lb., farm prices showed an increase of 75% over the corresponding figures for 1932, though they were still far below the prices of \$2.16, \$1.51 and 35.4 cents respectively for 1919. Agriculture, like every other domestic interest, was bound to be affected by the European war. Grain fields were being destroyed, animals slaughtered and millions of peasants driven into an exile of starvation. The U.S. had in 1940 an overabundance of food of all kinds. The president recommended an appropriation of \$50,000,000 for the refugees, and the question was being warmly debated as to whether the United States should undertake to feed the destitute people of Europe, as it did after the World War of 1914-18. The humanitarian demand was countered by the fear that whatever help was sent to the countries under Hitler's control would be seized by him to feed the nazis themselves or to relieve him from the responsibility of feeding his victims.

Labour Problems.—The long quarrel between the A.F. of L. and the C.I.O. showed no signs of abating in 1940, though President Roosevelt urged harmony in the ranks of labour as a necessary contribution to the unity of the nation in the face of its dangers. President Green of the A.F. of L. held to the idea that the younger seceding organization should return to allegiance to the parent body, which maintained the vertical craft union against the horizontal industrial union of the C.I.O. The latter won a notable victory in April, when 129,000 of the 137,650 workers of the General Motors corporation voted on the type of union they preferred for collective bargaining; and the C.I.O. captured 48 unions to only 5 for the A.F. of L. On the other hand, a split was threatened in the C.I.O. because its president, John L. Lewis, dissatisfied with the return which the Roosevelt administration had made for the substantial support of the C.I.O. in the elections of 1936, turned against the president and announced in Jan. 1940 that Roosevelt would meet with "ignominious defeat" if the Democratic party were "coerced or dragged" into re-nominating him for a third term. Lewis's candidate was Senator Burton K. Wheeler of Montana, and, when Roosevelt was re-nominated, he supported the Republican candidate Wendell L. Willkie, declaring that he would resign the presidency of the C.I.O. if Roosevelt were elected. He asserted that government contracts amounting to \$3,500,000,000 had been given to firms regardless of their obedience to the regulations of the NLRB. However, powerful unions in the C.I.O., like the clothing and textile workers, supported Roosevelt. At the convention of the C.I.O. at Atlantic City in November, Lewis resigned and was succeeded by Secretary Philip Murray of the United Mine Workers. The convention of the A.F. of L. at New Orleans in the same month re-elected William Green as president. Migratory labour remained a serious problem. Every year some 200,000 of these footloose job seekers flock to California, and New York state spent \$3,000,000 in 1940 in caring for needy nonresidents. Figures on unemployment vary widely between 8,000,000 to 9,000,000 estimated by Dorothy Thompson and Arthur Krock and the 12,000,000 claimed by the C.I.O. In spite of the upward turn in production, Welfare Commissioner William Hodson of New York declared on Dec. 22, 1940, that there was little hope that relief expenditures for the unemployed could be reduced. He pointed out that in the metropolitan district of New York

the state's unemployment insurance benefits had increased from \$55,000,000 in 1939 to \$70,000,000 in 1940.

The year saw no such severe strikes as those of the bituminous coal workers and the Chrysler automobile workers in 1939, nor was there any further "strike against the government" such as some skilled workers in the WPA staged in the summer of 1939 against changes in the WPA rules which threatened union standards of wages for work on government projects. But a danger signal was displayed when workers in the plant of the Vultee Aviation corporation in southern California went on strike in November. Since the Vultee factory was playing an important part in the defence program by manufacturing planes which were sorely needed by the government, the question arose whether strikes in plants producing war material should not be forbidden and even the wages and hours act be amended so as to permit overtime work in such plants without extra pay. As in 1916 (a year of an unprecedented number of strikes), the United States was presented with the problem of finding some compromise which would protect labour in its gains of a quarter of a century and at the same time ensure the uninterrupted production of materials necessary for the nation's defence. The problem in 1916 was happily solved by the creation of a War Labor board under the joint chairmanship of ex-President Taft and Frank P. Walsh, which settled over 1,000 industrial disputes and spared President Wilson from exercising the power, conferred on him when the U.S. entered the war, of taking over plants in which labour disputes threatened stoppage of war production. Sidney Hillman, able president of the Amalgamated Clothing Workers union and vice president of the C.I.O., was labour's representative on the National Defense Advisory commission, and to him would fall the special duty of seeking an adjustment of labour's interests to the government's needs.

The NLRB.—Ever since the establishment of the National Labor Relations board in 1935, criticism of its powers and practices, both by employers and workers, by the A.F. of L. and the C.I.O., has been rife. Though the record of the board over the five-year period has been excellent, with 92% of the 28,000 cases involving 6,140,000 workers settled by peaceful agreement, controversy raged over the alleged discriminations of the board in favour of the unions as against the employers and over the alleged favouring of the C.I.O. against the A.F. of L. Early in 1940 Senator Wagner of New York, the original sponsor of the National Labor Relations act, introduced a bill into congress for the establishment of a mediating board of three members in the department of labour, to persuade parties in dispute to accept arbitration. In March a special committee of the house, which had been appointed in 1939 to investigate the activities of the NLRB, reported recommendation of 21 changes in the original act. There was to be a board of three, as Senator Wagner proposed, to judge the cases in dispute. The board was to be compelled to hear complaints from the employers (heretofore optional) as well as from the unions. Restoration of back pay in cases where the board had upheld the strikers' cause was to be limited to six months, and there was to be no rehiring of workers who had practised sabotage. These (Smith) amendments to the NLRA were part of the unfinished business of the 76th congress when it adjourned.

In November Dr. Harry A. Millis, head of the department of economics at the University of Chicago and a former member of the NRA labour board, succeeded J. Warren Madden as chairman of the NLRB.

Transportation.—In spite of increasing competition from automobile, bus, truck and plane, the railroads held their own during 1940, and preserved their enviable record for safety. New streamline trains were added continually, cutting down the run-

ning time between the large cities. A new feature was the introduction by some of the major roads of de luxe coach trains, like the "Pacemaker" of the New York Central between New York and Chicago, which reduced the fare to less than half that on the Pullman trains, berth included.

In aviation the interest of the government and the people actually centred on the progress of military aeroplanes, in view of the feverish defence activities. But commercial aviation, too, made great strides during the year. New and improved types of planes were built, scores of new routes opened and hundreds of new airports laid out. The Civil Aeronautics authority recommended the construction of 4,000 airports at an estimated cost of \$560,000,000. On March 31 the largest seaplane basin in the world, costing \$7,500,000, was dedicated at the La Guardia airport on Long Island. By Jan. 1, 1941 there were 58 scheduled trips a day between New York and Chicago, and 38 planes in the Latin-American service arrived at or departed from Miami each week. In June passenger service to Alaska was inaugurated, reducing the time between New York and Juneau from seven days to 24 hours. In July clipper planes began a regular schedule of flights between San Francisco and Auckland, N.Z., covering in four and a half days the 8,000 mi. for which the fast steamers take 17 days. The network of American airlines in the countries south of the Panama canal was growing steadily denser. For the transatlantic clipper service (to Lisbon) which was inaugurated in June 1939, Pan American Airways ordered a new fleet of Super-clippers with a capacity for 50 passengers and 5,000 lb. of mail. Another triumph of Pan American is the Strato-clipper, designed to fly above the clouds at an altitude of approximately five miles, and supplied with devices for heating the rarefied air and conditioning it to human needs. On a test flight from Los Angeles to New York the Strato-clipper cut the time from 15 hr. and 47 min. to 12 hr. and 13 min. The first schedule of the new Clippers went into effect in July with a flight from Miami to Barranquilla, Colombia. An improvement in air-mail service was inaugurated by the introduction of the non-stop pick-up device, by which the low flying planes send down bags of mail on a sort of trolley and take the bags of "outgoing" mail from a wire stretched between two poles. In March the CAA was asked permission by one of the air lines to extend this service to six new routes in the eastern states, which would carry mail directly to about 125 cities and towns. Commercial aviation established a proud record for safety. After the tragedy at Oklahoma City on March 26, 1939, in which eight persons lost their lives, no major accident occurred until Aug. 31, 1940, when an airliner crashed near Lovettsville, Va., killing 25. During the 12 months following the Oklahoma accident the air lines carried 2,028,817 persons 87,325,145 mi.

A growing embarrassment to interstate commerce has been the laws, more than 1,000, enacted by state legislatures to control or prohibit goods entering from other states. For example, dairy states have banned the entrance of margarine in the interest of their own producers of butter; California has excluded oranges and grapefruit from Florida and Texas to protect its own fruit growers. Trucks are not allowed to bring more than a certain quota of gasoline into some states. Thus, on the ground of the protection of health, or for the encouragement of "home industries," or in regulation of highways, or by the legitimate exercise of the taxing power, practically every state in the union has discriminated against its sister states, in spite of the provision of the federal constitution giving to congress the power to "regulate commerce among the several states." The president's Tem-

THE DELEGATES of 21 American republics meeting at Havana July 22-30, 1940, reached rapid agreement on measures to ward off totalitarian threats in the western hemisphere

HOW THE VARIOUS STATES observed Thanksgiving day in 1940

porary National Economic committee investigated this perplexing situation during 1940, in the hope of getting the states to abolish their "ports of entry" and permit the country to become the great domestic free trade area which the fathers intended it to be.

Merchant Marine.—The new United States merchant marine which has been building up since the creation of the maritime commission in 1936 was threatened with a serious setback on the outbreak of the European war. By the Neutrality act, passed by the special session of congress in Nov. 1939, U.S. vessels engaged in foreign trade (more than 300) were barred by presidential proclamation from entering "combat areas," which extended from Norway to Spain. Over 80 vessels regularly sailing for Liverpool, Southampton, Cherbourg, Hamburg, Bremen, Rotterdam and Antwerp and employing some 5,000 seamen, were excluded from those important shipping centres. It looked as if the program of the maritime commission for the construction of 500 ships over a period of 10 years might be rudely interrupted. However, a number of factors combined to relieve the anxiety. Between the outbreak of the war and the spring of 1940, 90 vessels were sold, at advantageous prices to England, France, Greece, Brazil and other countries; many U.S. vessels were transferred to trade with Latin-America and the far east; and substantial increases in freight rates took place. As a result, the midsummer of 1940 saw work progressing on 118 ships for the maritime commission, to cost \$300,000,000, and private companies were spending another \$40,000,000 for cargo carriers and oil tankers.

Foreign Trade.—United States exports for 1940, thanks largely to the buying of the European Allies, reached the highest level since 1929-30, amounting to approximately \$4,000,000,000. During the first two months of the year, for example, the Allies spent \$23,000,000 in the United States for planes and engines. Trade with Great Britain increased from 44% of U.S. exports in January to 66% in September, and registered a total of about \$1,500,000,000—a gain of 88% over 1939. Owing to the war, the relative rank of U.S. exports was shifted. Aircraft and parts rose from 9th to 4th place and iron and steel products came up from 3rd place to the top.

Imports of \$2,500,000,000 featured rubber, coffee, silk, cane sugar and tea among the leaders. On Jan. 26 the commercial treaty of 1911 with Japan (which had been denounced the previous July) was abrogated; but there was no noticeable interruption of the trade which had been supplying the Japanese with more than half their war material. Two months after the expiration of the treaty, Japan concluded a trade pact with Argentina. Secretary Hull's negotiations with the latter country for a reciprocal pact had broken down, and Argentina remained the only Latin-American country to refuse any trade concessions to the United States. The thinly veiled economic hostility of the

Argentina to the United States is due partly to the fact that the balance of trade between the two countries runs in U.S. favour by about \$15,000,000 a year, and partly to the competition of the chief export commodities, beef and wheat, with U.S. products. Some years ago the United States excluded Argentina's chilled beef from its ports because of the alleged hoof and mouth disease of their cattle; and they were not even permitted to exhibit their beef at the New York and San Francisco fairs. In March the house voted 216 to 168 to renew for another three years Secretary Hull's authority to conclude his reciprocity pacts, and the senate, after a debate of two weeks, concurred. The considerable opposition to the policy both in house and senate was not so much due to dissent from the purpose of the pacts as to the contention that they should be submitted to the senate for ratification.

Social Security.—On Jan. 1, 1940, in accord with the 1939 amendments to the Social Security act advancing the date from Jan. 1, 1942, the first payments from the social security fund to persons of 65 who were covered by old-age insurance were made. Workers who had contributed 1% of their wages or salaries to the fund since 1937 were to receive an average of \$20 to \$25 a month. The amendments had also continued the 1% assessment on workers and employers until 1943, in place of the original clause to advance the rate to 1½% in 1940; and extended the benefits of the act to various classes of workers heretofore excluded, as well as to their wives, widows and children. Altogether about 45,000,000, or a third of the population, were in 1940 eligible to participate in the social security program. Senator Wagner of New York, who has been the foremost champion of labour and social legislation in the administration, proposed a health bill providing for the building of hospitals and health centres, for which he would have the government appropriate \$80,000,000 the first year, with annual increases to reach the figure of \$850,000,000 in ten years. It is a utopian program. The president has not shown much interest in it, as might be expected from the state of the budget, and the American Medical association remains generally hostile to the introduction of socialized medicine.

Housing.—A major problem ever since the beginning of the depression has been the shortage of houses and apartments at a rental within the capacity of poor families to pay. The close relation of disease and crime to inadequate housing is everywhere recognized. It is estimated that slums in United States cities are directly responsible for 75% of the juvenile delinquents, and in many rural areas, especially in the south, families live in shacks and huts that are hardly fit for animals. A report of the United States Housing authority's administrator Nathan Straus, in Dec. 1939, showed that nearly 10,000 substandard dwellings in 26 states had been replaced and that over 125 new projects of the sort were under way. But only a few of the new accommodations (perhaps 15%) were within the means of the vast majority of urban workers living on incomes of less than \$2,000 a year. The report stimulated great interest in housing, as illustrated by a series of 13 weekly broadcasts over Columbia Broadcasting System beginning March 24, 1940, entitled "Roof Over America." In the same month of March the USHA inaugurated a program for the construction in six rural counties in Arkansas, Georgia, Illinois, Indiana, Mississippi and South Carolina, of 1,300 farm dwellings at a cost of \$2,000 each, to rent for \$50 a year—a program made possible by the addition of \$800,000,000 to the USHA's funds by act of congress in 1939. Of course, the 1,300 habitable farm buildings would be but a drop in the bucket, compared with the 3,000,000 such dwellings which the Farm Security administration says are needed.

The housing problem was rendered more serious by the sudden

demands made by the program of national defence. Camps had to be built for the hundreds of thousands of men to be called up by the draft. Other hundreds of thousands flocking to the shipyards, the machine shops and the aircraft factories had to be housed. Men were in 1940 sleeping in hallways and cellars at the Norfolk shipyards. A government arsenal at Rock Island, Ill., increased its pay roll from 1,000 men in 1933 to 5,000. The Glenn Martin aircraft plant outside Baltimore, Md., secured funds from the federal housing authority to construct 200 dwelling units for its new workers, and about \$2,000,000 was lent by the FHA to build dwellings near the army and navy air stations at Montgomery, Ala. and Pensacola, Fla. It is estimated that the cost to the government of housing the new workers on the defence program will amount to \$700,000,000, a part of which the government hopes to recover when peace comes by the sale of the dwellings to private investors. (See also HOUSING.)

National Defence.—Although the size of the U.S. military and naval establishments necessary for the defence of the country on both the Atlantic and the Pacific fronts was a perennial question, it was not until Hitler started his *Blitzkrieg* with the invasion of the Low Countries in May that the danger to the United States in case of his subjugation of Europe became manifest. On May 28, 1940, as France was succumbing to Hitler's drive, President Roosevelt set up a Council of National Defense patterned somewhat on President Wilson's council of 1916. It consisted of six cabinet members (war, navy, agriculture, interior, commerce and labour) with an Advisory commission of seven industrial experts, headed by William S. Knudsen, president of the General Motors corporation. Seven months later, as defence preparations were lagging, a White House parley advised a smaller "super-commission" to be known by the cumbersome title of Office for Production Management for Defense, later called Office of Production Management. Mr. Knudsen was continued as chairman, and to him were added Secretaries Stimson and Knox and Sidney Hillman. The original commission, however, was not disbanded. The council of 1916 had been converted into the War Industries board early in 1918; but President Roosevelt, declaring that the business of rearming America was "too large and complex a job for any one man," made the categorical statement that there would be no "defence czar" in the present crisis. The four members of the new commission were to have full power to determine policy regarding production of war material, purchases and priorities—subject, of course, to the president's supervision. The authority for the establishment of the commission was derived from the Reorganization act passed by congress in 1939.

On May 10, the very day that Hitler invaded the Netherlands, the president, speaking before the eighth American Scientific congress at Washington, indulged in the most outspoken criticism of the totalitarian powers since his "quarantine" speech at Chicago in Oct. 1937. He declared that "we Americans of the free

Americas" were "shocked and angered by the tragic news" from Europe, which held the warning that America was not safe. At the same time he asked congress for a third \$1,000,000,000 for defence, declaring that 50,000 planes a year (or four times the normal rate of production) were necessary for the protection of the western hemisphere. On June 10, at the University of Virginia, he attacked the dictator governments for their appeal to "the gods of force and hate," and scored Mussolini for entering the war to give France a stab in the back just as the French army was about to capitulate to Hitler. Again, in his Columbus day speech (Oct. 12) he defied the axis powers, which Japan had joined in an offensive and defensive alliance, and asserted: "No combination of the dictator countries of Europe and Asia will stop the help we are giving to almost the last free people now fighting to hold them at bay." All aid to Britain short of war was the slogan which won the assent of the majority of the people of the United States. Two obstacles, however, stood in the way of help. The government of a neutral nation could not furnish military aid to a belligerent power, and the Johnson act of 1934 forbade making loans to countries that had defaulted on the debts they owed the U.S. from the World War of 1914-18. President Roosevelt, however, found ways of circumventing both of these obstacles. In September, as commander-in-chief of the navy, he made a deal with the British, by which he delivered to them 50 superannuated but useful destroyers in return for a 99-year lease on eight British locations suitable for naval bases on the Atlantic coast from Newfoundland to British Guiana. There was criticism of the president's action, both on the ground that it was taken without consulting congress and that the transfer of the destroyers would weaken U.S. naval defence. But public opinion supported the president. As for the Johnson act, it might, of course, be repealed as many wished, but, if not, there was still a way of helping Britain without making direct money loans. The president suggested encouraging the British to secure credits in the United States to the amount of \$3,000,000,000, which was a virtual guarantee of the debts incurred. Like the destroyer deal, this policy looked toward eventual defence. (See also DEFENCE, NATIONAL.)

The Navy.—The navy is the first line of defence, and it is the branch of the service in which President Roosevelt is most interested. The budgetary provisions of more than \$1,000,000,000 for the navy in January, though the largest in United States history, were seen to be inadequate if the United States was to have the "two-ocean navy" capable of defending both the Atlantic and the Pacific coasts. A naval expansion bill, urged by Secretary Charles Edison, called for 100 more ships at a cost of \$1,300,000,000, to bring the totals to 18 battleships, 11 aircraft carriers, 53 cruisers, 88 submarines and 200 destroyers, 167 of the latter being in 1940 "over-age." In April congress approved two additional battleships of 45,000 tons. These floating fortresses, the "Iowa" and the "Missouri," were to be equipped with nine 16-in. guns mounted on triple turrets and to have a speed of 38 knots. The work on the "Iowa" was being speeded up and the keel of the "Missouri" was to be laid in the Brooklyn yards early in 1941. On July 20 the president signed a new bill authorizing

ADVISORY COMMISSION of the U.S. national defence council appointed by President Roosevelt May 28, 1940. Left to right: Chester C. Davis, Harriet Elliott, William S. Knudsen, Edward R. Stettinius, Jr., William McReynolds and Ralph Budd. Leon Henderson and Sidney Hillman are also members. Mr. Knudsen on Dec. 20 became director of a new "super-defence" board, and Sidney Hillman was later named associate director

a 70% increase in naval strength, 92 of the previously authorized vessels being in 1940 under construction. The U.S. was rapidly approaching in 1940 the \$4,000,000,000 naval program recommended by Admiral Harold Stark. The 200 ships authorized by the new act would raise United States fighting strength by 1946-47 to 35 battleships, 88 cruisers, 150 submarines and 378 destroyers. According to Senator Walsh, chairman of the committee on naval affairs, the cost of providing the plant expansion for building the great two-ocean navy, the necessary bombs, shells, torpedoes and planes, the seamen, officers and pilots, would reach the staggering sum of \$10,000,000,000. A bill to speed up naval construction was passed by congress in June, giving the president the power (unprecedented in peacetime) to take over and run under government operation any manufacturing plant that he considered necessary for national defence. Partly in order to provide room for the passage of the largest war vessels and partly as an added protection to a vital spot in naval defence, construction was planned to begin on a third set of locks at Panama, 200 feet longer and 25 feet wider than the present locks, and situated about three-quarters of a mile from them. This new passageway from the Atlantic to the Pacific would cost approximately \$275,000,000. It would be completed in about 6 years.

Aircraft.—Planes have assumed a greater importance in this war than any other instrument of destruction. No part of the U.S. defence program was so widely criticized for inefficiency and lagging as was the aircraft production—or lack of production. In May 1940 the United States had about 5,000 planes but according to Chief of Staff General George C. Marshall not more than 1,500 of these were suitable for use. In Sept. 1940, after the war had been going on for a year, the United States was building fewer than 1,000 planes a month, though it was hoped that the number would be raised by 50% early in 1941. Controversy was sharp over the question whether planes could be produced in mass like automobiles or whether the machine tools used in the manufacture of autos could be adapted to plane production. The National Defense Advisory commission reported in September that when the proper tools were installed in the factories the production of planes would be speeded up to 3,000 a month (by the end of 1941). The Reconstruction Finance corporation had already loaned the Wright Aeronautical company \$92,000,000 for a factory to build 12,000 aeroplane engines a year. On Dec. 23 Philip Murray, the new president of the C.I.O., lunched with President Roosevelt and submitted to him a proposal to begin mass production of planes at once, by converting the unused capacity of the automobile plants (like the idle Hupmobile factory) into plane plants, and promised 500 planes a day when the peak of production should be reached in 1942. But Mr. Murray's proposal, though favourably commented on by the president, was regarded by the experts who were familiar with the difficulties of plane production rather as a token of labour's readiness to contribute its utmost to the program of national defence than as a feasible scheme. A further subject of controversy was the disposition of the planes: Should a large number of them be shipped to Europe to help the Allies, or not? In 1940 the United States was sending abroad approximately one-third of the planes manufactured. Statistics show that, whereas in Aug. 1939 exports of aircraft and parts amounted to \$12,000,000, by Aug. 1940 the figure had mounted to \$36,500,000, Great Britain taking the major part.

Conscription.—The question of universal military training has been agitated almost continually since the World War of 1914-18. Its advocates have seen it as a necessary step in preparing the nation for an eventual war to preserve democracy, while opponents have feared that it would be the entering wedge of militarism. The change in popular sentiment on this question, as the danger of a complete Hitler victory loomed larger, was regis-

"ACH! YOU'RE JUST SEEING THINGS under the bed," says Hitler in this cartoon by Herb Block of NEA Service on the subject of Fifth Columns

tered by the Gallup polls. Soon after the Munich conference of Sept. 1938 only 37% of the voters in the polls favoured universal military training. With the opening of the blitzkrieg in the west in the spring of 1940 the figure had increased to 50%; and after the Germans entered Paris on June 14 the poll showed 64% of the voters in favour of conscription. On the 20th of the same month E. R. Burke of Nebraska introduced a bill for conscription into the senate, and on the next day the bill was presented to the house by Representative James Wadsworth of New York. The bill was patterned on the Selective Service act of 1917, and stated in section 2 that "to insure the independence and freedom of the United States" it was "imperative that immediate measures be taken to mobilize the nation's strength," and that adequate forces could not be raised by voluntary enlistments. At the same time a joint resolution of congress, effective until June 30, 1942, empowered the president to order the national guard (242,000 officers and men) and the regular army (about 300,000) to active duty. The senate and house bills on conscription differed in respect to the age of registrants, the number to be drafted, the conscription of industry and other minor matters. But after a debate of three months the Selective Training and Service act was passed by a majority of two to one in both houses on Sept. 14, 1940 and signed by the president. (See SELECTIVE SERVICE.)

Hemisphere Defence.—The danger of a complete nazi victory in Europe has aroused the United States to a concern not only for its own safety, but for the protection of the whole western hemisphere. Since the Declaration of Lima in Dec. 1938, three months after the Munich "appeasement," several important steps had been taken to create an all-American front against the dictators. In the spring of 1939 President Roosevelt declared that the United States was ready, by force if necessary, to help the Latin-American countries maintain their independence against foreign aggression and the propaganda of nazi and fascist agitators within their borders. After the European war broke out the American republics agreed to establish a neutral zone extending 300 mi. from

their coasts and warned belligerent vessels to refrain from engagements therein. When Holland and France succumbed to Hitler the danger of nazi aggression in the hemisphere became acute, for both those countries have important colonial possessions in the Caribbean region which might serve as German bases for an attack on South America or on the Panama canal, the latter being only 750 mi. from the Dutch island of Aruba with its gigantic oil refineries. The senate, by a unanimous vote (78 to 0), resolved to prohibit the transfer of any territory in the western hemisphere from one non-American power to another; and a conference of American foreign ministers at Havana in July established a joint trusteeship over European colonies in the hemisphere and agreed that, in case of the attempt of Germany to seize any of those colonies, any American republic which felt itself threatened might take over the colony by force. Furthermore, in order to detach the Latin-American states from their economic dependence on Europe, President Roosevelt on the second day of the conference asked congress for an increase of \$500,000,000 in the capital of the Export-Import bank and later in the year proposed the formation of a \$2,000,000,000 inter-American corporation, financed largely by the United States, to give economic aid to the Latin-American states by encouraging their self-sufficiency in production and even purchasing their surpluses. The difficulty of such a scheme, however, becomes apparent when it is remembered that from 1930-40 65% of Latin-American exports, or one-third of their production, has gone to European countries, and that great numbers of the 15,000,000 Germans, Italians and Japanese in Latin America sympathize with the nazi program, to say nothing of the other millions who fear "Yankee" economic imperialism quite as much as the German type, or of United States producers of the agricultural commodities which furnish the bulk of the exports of those countries, who would resent the intrusion

MORE THAN 200 NEW U.S. CITIZENS took the oath of allegiance simultaneously before a federal judge in Detroit March 11, 1940

of such commodities into the United States. It is obviously not easy under these conditions to create an all-American front; but still the increasing danger of the encirclement of America by nazi bases reaching from (Danish) Greenland around to (French) Guiana, with the (Portuguese) Cape Verde islands nearer to the South American coast than New York is to St. Louis, may yet unite the wavering Latin-American states in a hearty co-operation with their northern neighbour for the common defence of the western hemisphere. (See HISPANIC AMERICA AND THE EUROPEAN WAR.)

Latin-American Relations.—Apart from the problems discussed in the preceding paragraph, there is little to say on United States relations with Latin America. On July 7 General Manuel Avila Camacho, the candidate of the Popular Front, defeated General Juan Almazán for the presidency of Mexico in an election which cost 47 lives. U.S. vice-president-elect Henry A. Wallace attended the inauguration ceremonies in December. In contrast with improved relations with Mexico, friction with Argentina, due largely to economic rivalry, has been disturbing. However, relations with the latter country were bettered toward the close of the year by the advance of a \$50,000,000 credit for the purchase of goods in the United States and of another \$50,000,000 to help stabilize Argentina's currency. Efforts to bring the Latin-American republics into closer cultural relations with the United States were constant. In the summer of 1940 more than 50 American students attended the University of San Marcos (the oldest on the American continents) at Lima, Peru, and others went to the universities of Bogota in Colombia and Chile at Santiago. In return, many Latin-American students who in normal times would have gone to the universities of Europe went to the United States, about 1,400 of them having registered at 158 universities during the year 1940. It is expected that the 11,500-mi. highway from New York to Buenos Aires (8,200 mi. of which were open in 1940) will be completed by 1942, furnishing a new link, together with the rapidly thickening net of airways, to bind the two continents of the hemisphere together.

Foreign Relations.—The war determined the trend of United States foreign policy in 1940, just as it dictated the defence program. At the beginning of the year, before Hitler had invaded Scandinavia, the Low Countries and France, the United States was chiefly concerned with maintaining a strict neutrality which should keep it out of war. But as the year closed, with Britain fighting desperately to preserve the democratic way of life,

"LET COME WHAT MAY." An unencouraging view of U.S. preparedness in 1940, by Carlisle of the Des Moines Register

isolationism changed into a determination to aid Britain short of actually entering the war. On the evening of Dec. 29, 1940, President Roosevelt spoke to the American people (and the whole world) from the White House, declaring that never since Jamestown and Plymouth Rock had American civilization been in such danger, that "the masters of Germany have made it clear that they intend to enslave the whole of Europe and then to use the resources of Europe to dominate the rest of the world." He asserted that "the United States has no right or reason to encourage talk of peace" until the axis powers are defeated, and he called upon the nation to unite in pushing the defence program "without interruption by strikes or lock-outs." Neutrality was wearing thin. United States citizens who did not agree with the president's words believed that the U.S. was headed for war. The isolationist Senator Hiram Johnson, on leaving California to begin his fifth term at Washington, said he was "off to the war." The Johnson act still stood on the books; but the United States was about to "evade" it by guaranteeing huge credits to Britain, should it need them. The Neutrality Act of 1939 had not been repealed; but the United States had already sent 50 destroyers to Great Britain. Sentiment was stirring that the 500,000 tons of Danish, German, Italian, Dutch and French merchant ships immobilized in United States ports should be seized and delivered to Britain—a procedure which Berlin warned would be an act of war. On Feb. 9 the president sent Undersecretary of State Sumner Welles to Europe to report to him on the situation in England, France, Germany and Italy. Welles was politely but coolly received in the totalitarian states, and heard Hitler's demand for the end of "British imperialism," the return of the German colonies and nazi domination over Czechoslovakia, Poland and Hungary. The reiterated demands of Hitler persuaded the "interventionists" (including the president) that safety for the United States lay in the defeat of the axis powers. "If the Allies lose this war," said Dorothy Thompson in June, "it will prove to be the worst catastrophe for the United States in our whole history." "To ask that we be neutral in this war is the height of folly," said William Allen White. On the other hand, the "isolationists," like Lindbergh, General Robert E. Wood and Senators Taft, Vandenberg, Walsh and Johnson, while advocating the maximum arming for defence, were firm in the opinion that the United States should refuse to become involved in the European conflict.

Japan continued to be a source of anxiety in the far east. In September its armies invaded French Indo-China (a country of 23,000,000 people, rich in rubber, coal, tungsten and other minerals), with the apparent purpose of establishing bases for attack on the East Indies or on China proper. The United States immediately put an embargo on scrap iron and steel, and Japan replied by signing a triple alliance with Germany and Italy at the chancellery at Berlin (Sept. 27). The alliance was evidently aimed at the United States, and the Japanese foreign minister Matsuoka, though declaring that his country wished to avoid any conflict with the United States, acknowledged that if the United States should go to war with the axis powers Japan would have to join the fight against the U.S.

Secretary Hull flatly told the Japanese ambassador at Wash-

ington that "a showdown would have to come if Japan persisted in her present course."

The Election of 1940.—For the presidential election details see DEMOCRATIC PARTY; ELECTIONS; REPUBLICAN PARTY.

Changes in Personnel.—The end of the year saw only three members of Roosevelt's original cabinet in office (secretaries Hull, Ickes and Perkins). The resignations of secretaries Edison and Woodring of the navy and war departments were followed by the appointment of two noted Republicans, Frank Knox of Chicago and Henry L. Stimson of New York to their respective posts.

Harry Hopkins (commerce), James A. Farley (postmaster general) and Henry Wallace (agriculture) left the cabinet, to be replaced respectively by Jesse Jones, Frank Walker and Claude Wickard.

Frank Murphy (attorney general) was appointed to the supreme court to succeed Pierce Butler, and Robert Jackson took Murphy's place. Admiral William D. Leahy, former governor of Puerto Rico, was sent in December as ambassador to the Vichy government in France.

Transportation.—For statistics on transportation and communications see the articles AVIATION, CIVIL; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; MOTOR VEHICLES; POST OFFICE; RAILROADS; SHIPPING, MERCHANT MARINE; TELEPHONE.

Agriculture.—Production in 1940 was well above the 1929-38 average, and most crops were also above the output average of the previous year. The total acreage for harvest in 1940 was estimated at 315,909,000, a slight increase over the 311,921,000

* Preliminary.

ac. harvested in 1939. Excellent crops were reported for oats and barley, whereas corn and rye showed decreases among the grains. Tobacco, suffering from export losses, was below its 1929-38 average of production; the acreage for harvest was only 1,437,000 as compared with 2,014,000 in 1939. The production of feed grains for all purposes was estimated at 98,500,000 tons. Table I shows the production figures of selected crops since 1932.

Shipments of cattle at public stockyards through Oct. 1940 were 5,078,000 (4,990,000 in the same period for 1939); calves, 2,179,000 (2,276,000); hogs, 7,352,000 (5,735,000); sheep and lambs, 9,666,000 (10,304,000).

Table II lists average prices received by farmers for important crops on selected dates (all in cents).

Manufactures.—The preliminary report of the department of commerce's census of manufactures for 1939, issued Jan. 15, 1941, estimated the number of establishments at 184,244, salaries and wages at \$11,631,967,995 and value of products at \$56,828,807,223. The leading industrial groups with their values of products were as follows: food (\$10,603,950,671), iron and steel (\$6,591,530,456), motor cars (\$4,047,872,729), textiles (\$3,897,437,872), chemicals (\$3,733,657,723) apparel (\$3,358,255,400), machinery, except electrical (\$3,254,173,950).

Labour.—For data on labour in 1940, see the articles AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; RELIEF; SOCIAL SECURITY; STRIKES AND LOCK-OUTS; UNEMPLOYMENT; WAGES AND HOURS.

Foreign Commerce.—In 1940 the United States had the largest favourable balance of trade since 1921. Exports through November totalled \$3,703,099,000 and imports \$2,371,982,000, leaving an export balance of \$1,331,117,000 for the first 11 months, as compared with a balance of \$737,857,000 in the same period of 1939 and \$1,036,415,000 in the same period of 1938. Table III shows foreign trade in merchandise for the first 11 months of 1939 and 1940 by continents.

Table III.—U.S. Foreign Trade in Merchandise, by Continents,
First 11 Months of 1939 and 1940

U.S.A.	Europe	N. America	Asia	S. America	Africa	Oceania
1939 exports . . .	\$1,128,877	\$729,759	\$491,817	\$285,159	\$103,770	\$70,101
imports . . .	559,063	530,535	609,859	279,808	66,684	24,346

imports . . .	363,724	634,071	883,120	340,942	117,492	26,633

Exports to the United Kingdom through Nov. 1940 amounted to \$908,648,328 as compared with \$454,793,418 in 11 months of

1939. Only nominal exports were being shipped to France by the end of the year, but the U.S.A. continued to import from that country at approximately a third of the 1939 rate. Exports to Germany likewise approached the vanishing point.

Iron and steel products and industrial machinery both displaced petroleum as the leading U.S. exports in 1940. Aircraft and aircraft parts rose from ninth in value to fourth. Coal also showed a notable increase, whereas tobacco dropped from \$86,145,000 in Jan.-Nov. 1939 to \$52,530,000 in Jan.-Nov. 1940. Rubber was again the leading import, followed by non-ferrous metals, paper and sugar. Coffee dropped from third place to sixth in import values in 1940.

Table IV.—Leading U.S. Exports and Imports—through Nov. 1940

Exports		Imports	
Products	Value	Products	Value
Iron and steel products . .	\$532,757,342	Rubber and manufactures	\$284,998,044

Mineral Products.—Statistical information on the mineral industry released by the bureau of mines of the U.S. department of the interior in 1940 pertained to the year 1939 (see also separate articles on minerals and metals). According to preliminary estimates, the total value of all mineral production in that year was \$4,874,000,000, an increase of 12% over the \$4,362,900,000 of 1938. In 1937 the value was \$5,413,400,000. Metals as a group were mostly responsible for the increase in value of production in 1939, the value of non-metallic minerals being only slightly above the \$3,471,000,000 of the preceding year. Fig

Table VI.—Leading Mineral Products of the U.S., 1938 and 1939

Mineral	1938 value	1939 value
Petroleum	\$1,373,060,000	\$1,265,000,000
Bituminous coal	678,653,000	732,534,000
Pig iron	356,875,369	626,824,600
Natural gas	500,698,000	539,625,000
Coke	167,181,834	212,884,050
Gold	178,143,400	196,391,000
Pennsylvania anthracite . .	180,600,167	187,175,000
Cement	156,703,002	184,254,932
Iron ore	74,322,405	158,511,338
Stone	139,255,046	158,461,515
Copper (domestic ores only)	110,216,000	148,236,000

iron rose sharply from \$356,875,000 to \$626,825,000, as did iron ore—from \$74,322,000 to \$158,511,000. The leading mineral products of the U.S.A. in 1938 and 1939, each with an output value of more than \$100,000,000 in the latter year, are shown in Table VI, on p. 691.

Finance and Banking.—Statistics pertaining to the United States will be found in separate articles such as BANKING; BONDS; BUDGETS, NATIONAL; FINANCIAL REVIEW; GOLD RESERVES AND GOLD STANDARD; NATIONAL DEBTS; NATIONAL INCOME; STOCK EXCHANGES; STOCKS; TAXATION; WEALTH AND INCOME, DISTRIBUTION OF.

Defence.—The year 1940 saw the greatest peacetime military activity in the nation's history and the introduction of selective service.

For more complete details see DEFENCE, NATIONAL. At the end of 1940 the actual strength of the U.S. army by components was as shown in Table VII.

Table VII.—U.S. Army Strength, by Components, Dec. 31, 1940

	Commissioned Officers	Warrant Officers	Enlisted Men	Totals
Regular Army*	14,325	668	415,472	430,465
National Guard†	9,235	80	130,574	139,889
National Guard‡	9,773	118	120,912	130,803
Selective Trainees	—	—	19,259	19,259
Organized Reserves§	123,822	—	6,437	130,259
Regular Army Reserves	—	—	29,021	29,021
Aggregate	157,155	875	721,675	879,705

*Includes retired personnel on active duty. †In federal service. ‡In state service. §Of this number 24,058 were on active duty Dec. 31, 1940.

Expenditures of the U.S. war department for the fiscal year ended June 30, 1940 were \$915,914,102. The U.S. navy at the end of the fiscal year 1940 had 139,554 enlisted men and 10,817 line officers on the active list.

The U.S. marine corps had an average enlisted strength of 25,000 men during the year.

Recorded expenditures of the department of the navy for the fiscal year 1940 were \$885,769,793.59 as compared with \$660,206,184.96 in 1939.

Table VIII shows a summary of U.S. vessels as of June 30, 1940.

Table VIII.—Summary of U.S. Naval Vessels, as of June 30, 1940

	Number (including over-age)	Building
Battleships	15	10
Aircraft carriers	6	5
Cruisers	37	21
Mine vessels	36	4
Destroyers	225	61
Submarines	101	41

The battleships under construction on Dec. 31, 1940 were the "North Carolina," "Massachusetts," "Iowa," "Wisconsin," "Washington," "Indiana," "New Jersey," "South Dakota," "Alabama" and "Missouri." The numerical strength of the U.S. navy at the end of 1940 is discussed in the article NAVIES OF THE WORLD.

For additional data on the U.S. armed forces see AIR FORCES; ARMIES OF THE WORLD; MARINE CORPS; NATIONAL GUARD.

United States Antarctic Service: see EXPLORATION AND DISCOVERY.

United States Housing Authority: see HOUSING; MUNICIPAL GOVERNMENT.

United States Mint: see COINAGE.

Universities and Colleges.

The growing tensions of the European war were reflected in the activities of United States colleges and universities. Students were active in considering war issues as debated in congress and elsewhere. On the whole, there was general concurrence in the defence program of the selective draft. The U.S. Civil Aeronautics authority organized courses for the training of civilian fliers in hundreds of institutions. These attracted a large number of students. Engineering colleges responded to the request of the government for intensive short training courses in skills essential to the defence program. Many medical colleges organized their hospitals into base units for the United States army or navy. The National Research council made a personnel inventory of the intellectual resources of the country for a scientific program of defence. This included academic staff members and advanced graduate students.

Attendance in the recognized colleges and universities remained stable, although a slight reduction (2%) appeared in freshman registration which might presage some decline in future enrolment. The steady decline in elementary-school enrolment figures, which for several years obtained throughout the country, was in 1940 being reflected in high school attendance records. It was to be expected that this decline would later and further affect college enrolments.

The National Youth administration continued its policy of providing for the employment of a limited number of college students compelled to work to support themselves during the college course. In 1940, 170,000 students were thus assisted. Notable additions to physical plants were made at the publicly supported universities of Wisconsin, Minnesota, Purdue, Indiana, Penn State, Connecticut, Virginia, North Carolina and Alabama.

Junior colleges continued to attract a growing number of students. The 610 junior colleges reported had a total registration of 233,785, an increase of 18.8%.

The graduate enrolment was estimated to be over 90,000. There was concern lest there develop an oversupply of Ph.D. holders. In the decade closing 1938-39, the more important U.S. universities conferred more than 25,000 Ph.D. degrees. Of this number, more than 4,000 were in chemistry alone. There was growing recognition of the fact that the best students are most likely to find satisfactory appointments.

A number of the graduate schools were exploring ways and means to improve the quality of the students they admit. In co-operation with a group of school superintendents, the American Council on Education was experimenting with an objective examination in teacher selection, to be given after the completion of the prospective teacher's prescribed course. This examination procedure was in line with the long-established policy of the professions of law and medicine, where before admission to practice examinations are prescribed. The American Council on Education was also studying the product of teacher preparation in a selected list of 20 higher educational institutions including universities and liberal arts colleges as well as teachers colleges. A group of 22 colleges was engaged in a co-operative study of the special problems of general education as formulated by the Progressive Education association. Another group of well established liberal arts colleges on the eastern seaboard was attempting to evaluate the work of the conventional four-year liberal arts course.

In these inquiries thousands of students were being tested by one or another group of examiners.

Meanwhile, professional schools, especially of law, engineering and medicine, tended to insist less and less upon certain specific subjects or courses as prerequisites to admission. (W. A. J.)

Great Britain.—In Great Britain in 1940 the primary preoccupations

pation of university administration was with the possibility of maintaining instruction and providing facilities for research work. Fortunately the University Grants committee was able to renew its annual grant of over £2,000,000, so that, in spite of a reduction of the income received from students' fees, the financial problem was not acute. Further, the fact that the age for conscription was fixed at 20 enabled many students to begin their university work and make appreciable progress before being enrolled in one of the fighting services.

Most universities assisted students by providing that if they reached a certain stage in their studies they would be permitted to count towards their period of university residence a year of approved service with the forces. The tribunals set up under the National Service (Armed Forces) act to consider cases of hardship, liberally interpreted their powers of granting postponement, with the result that many undergraduates were enabled to complete their degree courses before being called up.

Another measure which conduced to the retention of many undergraduates at universities was the establishment of joint recruiting boards, with technical committees working in co-operation, who not only assessed the capacity for leadership among those who appeared before them, but also classed in several categories the attainments of those studying chemistry, engineering, mathematics and other scientific subjects. Medical, dental and veterinary students, who had reached a certain stage in their courses, were advised to continue their studies.

All the universities, except the majority of the colleges and schools of the University of London, continued their work at their usual headquarters. The evacuation of students from London caused some degree of hardship, but the hospitable arrangements made by receiving institutions mitigated the difficulties. That the evacuation was advisable was rendered plain by the savage destruction of University college and other centres of learning in the metropolis.

Other measures adopted by universities generally to meet wartime conditions included the conferment of powers, to ensure that the work of universities is carried on without some of the formalities of peacetime administration. Wider powers were vested in the principal officers. Degree days were abolished by many institutions. Prizes, fellowships, studentships and postgraduate scholarships were suspended in greater or less degree. Fees were refunded if a student was unable to complete his course.

Re-arrangement of timetables of lectures and laboratory work helped to mitigate the effect of the black-out restrictions. The consideration which had been given during the year 1938-39 to the possibility of war and its repercussions on university life found universities prepared. Shelters had been provided. Valuable books, documents and incunabula had been deposited in safe storage.

The establishment of a central register enabled universities to assist materially in the national effort by providing experts in scientific subjects, languages and administration for key positions in government and industry.

The numbers withdrawn from university teaching and research placed heavy burdens on those remaining; but the reduction in the number of students eased the situation. Universities were also able to house and provide facilities for a number of government departments—especially those engaged in secret scientific research work. They also accepted the responsibility for the training of officers in the technical services by the provision of short courses of instruction. Some were also able to help by allocating accommodation to officer cadet training units. Further assistance was given for the education of the fighting services by the establishment of a Central Advisory committee with regional committees at most of the university headquarters—lec-

ture courses being given by members of university staffs. Building schemes, proposals for the extension of departments and other capital charges had, perforce, to be suspended.

The influx of refugees from the continent of Europe and the necessity for taking precautions against espionage presented fresh problems to the universities. Members of staffs of foreign nationality who had been interned were assessed as to their usefulness as teachers and in most cases were released on the representations of the Committee of Vice-Chancellors and Principals. Similar action was taken in respect of interned students. Steps were also taken to accord hospitality to professors and other teachers of conquered countries with a view to the preservation of their national culture.

(See also CAMBRIDGE, UNIVERSITY OF; LONDON UNIVERSITY; OXFORD UNIVERSITY.)

British Empire.—Owing to war conditions reports from universities in the empire were delayed, and, in some cases, lost. But such as were received indicated that while university life and conditions had not so far been materially changed, action along lines adopted in Great Britain was being taken. Minor privileges were granted and slight deficiencies for degrees were overlooked when a student enlisted in the Canadian active service forces. Canadian universities were further requiring the military training of all male undergraduates who were physically fit and were 18 years or over at the time of registration. In the case of those who would be 21 or over in July 1941, the required courses of training would be equivalent to the military training demanded under the National Reserves Mobilization act.

In Australia the University of Adelaide speeded up the medical course by reducing the vacation periods and by other adjustments of the lecture timetable. Medical students who qualified for the degrees of M.B., B.S. before the normal time and offered and had been accepted for active service might apply for the immediate conferment of the degrees. In the University of Melbourne special arrangements were made for the examination of students whose studies were affected by defence duties. Provision was also made for adjustments of the curriculum in students' courses, which might be resumed after military service. The University of Sydney, in conjunction with the government, made provision for teaching and research in aeronautical science.

In South Africa the University of Cape Town introduced special emergency measures whereby all final year students were required to complete their examination in 1940 or later. Other students might be granted a pass in each subject taken in respect of which favourable recommendation was made by the board of the faculty concerned. Rhodes University college, of the University of South Africa, also made provision for special examinations for students who went on active service in 1940.

In India the University of Calcutta approved the grant of equivalence for the period spent by students at British universities for the purpose of completing degree courses. This university also appointed an organizer of physical education. In other provinces varying measures of compulsory training in higher education were adopted.

Europe.—Of universities in Europe little information was available in 1940. In the conquered countries higher education, in effect, ceased and the arrangements for the exchange of postgraduate research workers, gradually being introduced under the aegis of the British council, had come to a standstill.

The following seven pages carry a selected list of universities and colleges in the U.S. and Canada, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes, for the academic year 1940-41. An asterisk denotes 1939-40 data.

University Professors, American Association of: see ACADEMIC FREEDOM.

Untermeyer, Samuel (1858–1940), U.S. lawyer, was born in Lynchburg, Va., March 2, and died in Palm Springs, Calif., March 16. For a biographical sketch see *Encyclopædia Britannica*, vol. 22, p. 882.

Unwin, Sir Raymond (1863–1940), English town planner, was born in Oxford, November 2 and was graduated from Magdalen College school, Oxford. He studied engineering and architecture and practised from 1896 as an architect. He planned Letchworth, the first garden city in England and several other model cities. He was lecturer on town planning at Birmingham university from 1911 to 1914 and in the latter year was made chief town planning inspector of the local government board. During the World War of 1914–18 he was director of the housing branch of the ministry of munitions and after the war became chief architect of the ministry of health. He was appointed visiting professor of architecture at Columbia university in 1936. In 1937 he received the Royal Gold medal for distinction in architecture. He died in Lyme, Conn., June 28.

Urology. A new sulphonamide derivative, 2 thiazole (p-amino-benzenesulphonamide), or sulphathiazole, was added recently to the rapidly increasing list of therapeutic agents employed by the urologist. Apparently little doubt exists that sulphathiazole will prove to be one of the most effective members of the entire sulphonamide group. In the treatment of gonorrhoea, indications are that the drug may prove to be the most valuable agent. Sulphathiazole compares favourably with other members of the sulphonamide group in the treatment of infection in the urinary tract, and for uncomplicated infection with staphylococci, it appears to be specific. The large amounts of sulphathiazole found in the urine, as compared with sulphanilamide and sulphapyridine, and its intensification by passage through the body, suggest that it will be a more valuable urinary antiseptic than either of the latter. Although some cases have been reported in which haematuria and deposit of crystals followed its use, sulphathiazole usually is tolerated well and apparently is less toxic than other members of the group; however, the same care and observation of patients under treatment with sulphathiazole must be carried out as of patients under treatment with other sulphonamide derivatives. These drugs are dangerous if prescribed or used by those untrained in their use and none of the treatments referred to is to be employed except under the direction of a physician.

There has been continued interest in the problem of hypertension and unilateral renal disease. This problem presents a definite challenge to the urologist and has resulted in a plea for more careful study of disease of the kidneys as a possible cause of hypertension. Experimental research and clinical investigation have established relationship between non-nephritic renal lesions and hypertension and have given better understanding of the mechanisms involved. Hypertension in the presence of unilateral renal lesions has in some instances been relieved by surgical operations on the kidney. Although relief of hypertension was reported in some cases subsequent to conservative operation, it occurs most often after nephrectomy. Atrophic pyelonephritis, which occurs most often in association with hypertension, is the renal lesion that responds most readily to surgical treatment. This condition is unilateral and is characterized by extensive atrophy of the renal tissue, with sclerosis of the renal blood vessels. Although these pathologic changes usually are present, the underlying mechanism which causes the hypertension is not fully understood. Not in every case does the finding of a unilateral renal lesion in the presence of hypertension indicate that operation is advisable, for other conditions may be present which contraindicate surgical intervention. Finally, in evaluating the result of surgical operation on the kidney for hypertension, it is important that follow-up examinations of the patient be made over a period of at least a year to determine whether or not the improvement or apparent cure is permanent. Many cases were reported in which return of blood pressure to normal was only temporary. The problem is complex. An important fact which studies of histogenesis and morphology in different stages of pyelonephritis have made clear is that the clinical importance of pyelonephritis has been underestimated.

Recently, increased emphasis was placed on the role of calcium metabolism in the pathogenesis and treatment of stones in the urinary tract and on the importance of studying quantitatively the calcium excreted in the urine. The work accomplished in these respects appears to be a definite contribu-

tion to the prophylaxis and medical management of urinary calculi. This newer knowledge is especially valuable in prophylaxis against urinary calculi when there is augmented excretion of calcium in the urine. Preliminary studies show that when an increase in urinary calcium is present, acid-ash diets and vitamin D should be given with care; on the other hand, in cases of normal urinary calcium, benefit may be expected from the use of acid-ash diets and vitamin D. Moreover, in a consideration of recurrence of stone in a particular kidney, the possibility that urinary calcium is altered through that kidney is of importance.

The problem of treatment for stag-horn calculi, unilateral or bilateral, has always been difficult. Attention is called to the efficacy of timely surgical intervention to save the kidney, and emphasis is placed on the fact that if operation is performed early the risk is low. In addition to removal of the stones, correction of any pathologic change which may have occurred at the ureteropelvic junction or in the lower part of the ureter is important.

The therapeutic management of diverticula of the bladder has long been a subject of much interest and is worthy of mention. In a large majority of cases thorough transurethral resection of the vesical neck will relieve the obstruction and will obviate the risk, discomfort and prolonged hospitalization incidental to diverticulectomy. If surgical removal of the diverticulum becomes necessary, it can be accomplished without great difficulty.

The effect of sex hormones in the treatment of enlarged prostate gland was the subject of clinical investigation in recent years. Injection of the male hormone produces a temporary depletion of spermatozoa, and attention is called to the fact that its promiscuous use over a long period of time may be harmful to normal testicular function. Although some observers have reported reduction in size of the enlarged prostate gland after administration of the male hormone, permanent improvement of the bladder function does not usually occur. Recent reports following the use of the female hormone (di-ethylstilb-esterol) in the treatment of prostatic obstruction would indicate definite reduction in the size of the enlarged prostate gland and functional improvement in some cases. It remains to be seen, however, whether both the reduction in the size of the prostate gland and the amelioration of obstructive symptoms will be permanent.

Evidence collected thus far gives little support to the theory that malignant tumours of the bladder can be cured by roentgen therapy of super-voltage.

Cystometry again commanded the attention of urologists and increased interest in the physiology of micturition. Most important in this field is the trend to standardize nomenclature in cystometry and to establish broad, basic principles in classification of cystometrograms in both normal and pathologic states of the bladder. (See also CHEMOTHERAPY.)

Uruguay, a republic on the Atlantic coast of South America, between Brazil and Argentina; language, Spanish; president, General Alfredo Baldomir; area, 72,153 square miles. The population (1933 census: 1,993,234) was officially estimated at 2,132,888 in 1939. The percentage of whites is higher than in any other American country except Argentina and Canada. The chief cities are: Montevideo (capital), 684,036; Paysandú, 50,000; Salto, 48,000; Mercedes, 24,900; Fray Bentos, 18,000.

History.—Throughout 1940 Uruguay was torn by issues arising from European war developments. At the beginning of the year serious difficulties were experienced in handling interned German sailors from the auxiliary ship "Tacoma." As early as February, President Baldomir made strenuous efforts to further defences, but an apathetic congress rejected compulsory military service and other proposals. In June, baring of widespread fifth-column activities and pro-nazi plots to overthrow the government aroused great excitement which was calmed only by Brazilian loan of arms and munitions, the arrival of two United States cruisers and formal pledges by the United States minister of United States aid. Following these disclosures, conscription was enacted into law without serious opposition, and attention was given to suppression of fifth-columnism, although with but partial success.

Late in the year the paramount issue was the proposed granting to the United States of naval base rights at Punta del Este, on the Atlantic coast, as part of the hemisphere defence program. In the face of strong Argentine protest and bitter opposition within his own cabinet, some of whose members resigned, as well as in congress, President Baldomir pushed the project, but no definite plans had been made public by the end of the year. Meanwhile, on Dec. 14, after several days of conference at Colonia with the

Argentine foreign minister, Foreign Minister Guani announced an Argentine-Uruguayan agreement to co-operate in defence of the Río de la Plata area against non-American aggression.

In December, when the British auxiliary cruiser "Carnarvon Castle" visited Montevideo for repairs after an engagement with a German war vessel, leading newspapers advocated abandonment of neutrality and granting of unrestricted use of Uruguayan waters to British warships patrolling the south Atlantic.

Education.—Education is free and compulsory. There are 1,648 primary schools (1938 enrolment: 209,651). The National university, at Montevideo, has approximately 10,000 students.

Defence.—Uruguay has an army of 7,916, and other armed forces of 5,400. An air squadron of 45 planes is being expanded, as is the small naval force.

Finance.—The monetary unit is the peso (value: approx. 36 cents U.S.). The public debt was 398,084,266 pesos on Dec. 31, 1939.

Communications.—External communication is principally by water. Regular, frequent air service is maintained with Argentina, with three weekly flights by Pan American Airways to Brazil and northward. In July 1940 the latter service was improved and time from Montevideo to New York shortened to less than 48 hours. There are over 22,500 mi. of highways of all classes, and 1,683 mi. of railway. In 1940, 7,861,000 pesos were appropriated for highway development and extension during 1941, and 1,900,000 pesos for completion of a railroad already under construction to the Brazilian border.

Trade.—During 1939 and 1940 Uruguayan foreign trade suffered materially from imminence of war and actual war in Europe. In 1939, British, German and French purchases declined respectively 25.7%, 45.7% and 46%, while United States purchases increased 266.9% from an abnormal low in 1938. Exports in 1939 were valued at 101,366,303 pesos, a 5.2% increase, with livestock products comprising over 75%. Great Britain took 18.5% (1938: 26.1%); the United States, 13.9% (1938: 4%); Germany, 12.1% (1938: 23.5%); Brazil and Italy, 6% each (1938: 3.6% and 4.4%); France, 3.8% (1938: 7.4%). Imports (textiles, foodstuffs, fuel oil and miscellaneous manufactured goods) were 65,364,003 pesos, largely from Great Britain, 18.3% (1938: 19.8%); Germany, 16.4% (1938: 16.8%); Brazil, 8.6% (1938: 7.7%); and Japan, 2.7% (1938: 4.7%). In the first nine months of 1940 exports were 76,682,000 pesos (a 3.9% drop), imports 50,255,000 pesos (a 3% increase), with 15.9% to the United States, and 11.9% from that country. Chilled meat exports rose 9% in that period, due to heavy British purchases which averaged 4,000 tons monthly.

Production.—Cattle-breeding and sheep-raising are the chief industries, and nearly 80% of the land is in grazing. The chief agricultural products are wheat, linseed, maize and oats. Processing and packing of meat products is an important industry. (See also ARGENTINA; HISPANIC AMERICA AND THE EUROPEAN WAR.)
(L. W. BE.)

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Utah, a Rocky Mountain state, admitted to the United States in 1896, is popularly known as the "Mormon State": area, 84,990 sq.mi.; population in 1940, 550,310. In 1930 there were 495,955 native whites, 1,108 Negroes and 10,784 persons of other races, including 4,012 Mexicans, 3,269 Japanese and 158 Filipinos. Salt Lake City, the capital, had a population of 149,934 in 1940. Other cities: Ogden, railway centre (1940) 43,688; Provo, seat of Brigham Young university (1940), 18,071; Logan, 11,868.

History.—Mormon population of the capital is estimated at 40% and that of the rural districts at 60%. The Mormon social

security program has attracted national interest. In the 1940 presidential election, Nov. 5, 1940, Roosevelt received 154,277 votes; Willkie 93,151; Thomas 198 and Browder 191. The veteran United States Senator William H. King, conservative Democrat, failed to receive renomination and his seat went to Representative Abe Murdock. Walter K. Granger was sent to congress from the 1st district and Representative J. W. Robinson was returned by the 2nd district.

Herbert B. Maw, liberal Democrat, attorney, educator and

HERBERT B. MAW, Democrat, elected governor of Utah Nov. 5, 1940

former president of the state senate, was elected governor by a plurality of 10,806 votes over Don B. Colton (R). The new governor was preparing to offer the overwhelmingly Democratic legislature a progressive program including sweeping reforms in state government with a view toward efficiency and economy, and development of the state's natural resources. The legislature will also consider the report of a citizens' committee recommending reorganization of the administration of higher education.

Composition of the legislature: senate, Democrats, 19; Republicans, 4; house, Democrats, 44; Republicans, 16. In 1940 E. E. Monson was secretary of state; Reese M. Reese, auditor; Oliver G. Ellis, treasurer; Grover A. Giles, attorney-general; and Charles H. Skidmore, superintendent of public instruction.

Education.—The University of Utah, Salt Lake City, had in 1940 an enrolment of 4,315, the Utah State Agricultural college, Logan, 3,229, and Brigham Young university 2,782. With an enrolment of 137,434 students and a force of 4,607 teachers and principals and 1,000 other employees, the cost of elementary education was as follows: operating cost, \$9,754,606.30; capital outlay and debt service, \$3,510,482.48.

Defence, Agriculture, Manufacturing, Mining.—With \$36,599,370 authorized for defence expenditures in Utah, the state became a vital link in national defence. Major construction projects included Utah General depot, Hill field, Ogden Ordnance depot, Fifth Air base and Fort Douglas, Wendover Bombing range and Salt Lake Reception centre. Ft. Douglas was an important air base with 2,600 men and 260 officers. In the production of gold, silver, copper, lead and zinc, valued at \$86,440,325, Utah in 1940 led all western states. Manufacturing gains have been pronounced since 1933, and the last six months showed the largest employment and pay rolls of any given year, with products estimated around \$210,000,000. New enterprises during the last decade included oil refineries, textile mills, mining machinery, potato alcohol and dairy products. The United States bureau of mines erected a \$300,000 experiment station in Salt Lake City. With farm cash income totalling \$50,000,000, Utah farmers enjoyed the highest returns in a decade. The year 1940 brought additional irrigation development. Conservation facilities built or nearing completion had a combined capacity of 264,000 acre feet.

Uzbek S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Vanadium. Required as a constituent in certain types of high grade alloy steels and cast irons, vanadium is produced in considerable quantities. World production in 1939 was about 3,000 metric tons, of which Peru furnished 34%, United States 30%, South West Africa 17%, Northern Rhodesia 13% and Mexico 5%. There is a growing demand for vanadium catalysts in the production of sulphuric acid and certain organic compounds, as well as in the ceramic and dyeing industries. (See also RADIUM.) (G. A. Ro.)

Varnishes: see PAINTS AND VARNISHES.

Vassar College, Poughkeepsie, New York, completed its 75th year of instruction in June, 1940. The date was made the occasion of a celebration. The 75th anniversary series of publications, comprising more than 20 scholarly works in art, music, literature, biography and other fields, by members of the faculty and graduates of the college, has been published in honour of the 25th year of President Henry Noble MacCracken. The anniversary itself on the 8th, 9th and 10th of June was attended by over 3,000 graduates. The addresses and reports were published in July by the *Vassar Alumnae Magazine*. In honour of the event a fund of \$2,000,000 for the endowment of scholarships and educational expenses was planned. The campaign opened October 20 and more than \$1,950,000 was subscribed. Fifty thousand dollars additional were given for a housing project for members of the faculty. Greetings from alumnae in every part of the United States and from the 400 graduates resident in foreign countries were received. Many exhibitions of the work of Vassar graduates were given. The endowment of a graduate department of conservation, through the application of the sciences of zoology, botany, geology and psychology, was announced.

Jane North Baldwin House, a new 35-bed infirmary with the latest equipment, was opened in May. A new glass laboratory for the department of botany was completed in September, as was a sound-film studio for research in child development, a gift of the General Education board. (H. N. MacC.)

Vatican City State. A sovereign and completely independent domain, representing the temporal power of the pope. It was established in 1929, through the Lateran treaty between the Holy See and Italy. Adjacent to Rome and completely encircled by Italian territory, it covers only 108.7 acres. Within this small area are located the basilica of St. Peter, palace of the pope, Vatican library, museums, gardens and smaller edifices. Recognized as part of the papal domain and enjoying extra-territorial rights are 13 buildings in Rome and the villa at Castel Gandolfo. The population was in 1940 reduced to 750, consisting of ecclesiastical officials, guards, clerks and servants.

The pope, in his function of temporal ruler, exercises complete legislative, executive and juridical rights over Vatican City state. Three cardinals are commissioned to take charge of administrative matters. Papal gendarmes, numbering about 100, perform police duties, and the famous Swiss, Palatine and Noble guards assist at state functions and palace routine. Being a completely independent government, the Vatican City state has its own postage, coinage, flag, and has an internationally recognized diplomatic representation. Within its confines, all the affairs, spiritual and temporal, of the Roman Catholic Church as a world power are transacted. Upon the entrance of Italy into the war, the Vatican City state offered residence to diplomats and officials of nations at war with Italy. Vatican City citizenship was conferred on Italians serving in papal nunciatures and delegations accredited to countries hostile to Italy. The American, English, Scotch and many

other ecclesiastical colleges were closed. The semi-official daily, the *Osservatore Romano*, after reaching in 1939 a circulation of more than 200,000, fell to 10,000, following the Italian ban placed on it. It continued to speak strongly on international matters, condemning the invasion of Luxembourg, Holland, Belgium, etc., correcting the distortions of the Italian press on the peace speech by the pope in November, etc. The Vatican radio station, likewise, freely broadcast news, for example, about the conditions in Poland, and made efforts to locate refugees and to reunite families separated by the war. (See also PRUS XII.) (F. X. T.)

Vegetable Oils and Animal Fats. Edible oils and fats developed in 1940 into the most vulnerable point in the wartime food situation of Europe, owing to the prevention of imports of vegetable oils, oil-seeds and fats by blockade. Europe normally imports about one-third of its vegetable oils and fats from overseas. The average annual consumption, as estimated by the U.S. department of agriculture, was 5,700,000 metric tons, of which 1,840,000 metric tons were imported. Europe's average pre-war consumption of such oils and fats was divided into 2,850,000 metric tons of vegetable oils from oilseeds, 1,400,000 metric tons of butter of which Europe produces an export surplus, 1,120,000 metric tons of lard, and 330,000 metric tons of marine oils, all utilized chiefly in oleomargarine and cooking fats. In Germany, where the shortage of oils and fats was especially acute, seizure of Danish and Netherlands butter stocks helped temporarily to fill what is known as the "fat gap." Some further relief in the fat shortage was developed in Germany by introducing soybean bread into the army ration. Chemists discovered methods of eliminating the bitter taste from soybean flour, which has a high fat content, and which could be increased by soybean imports from Danube countries. (See SOYBEANS.) A large part of the dairy cattle feeds in Germany, Denmark, the Netherlands and Belgium is dependent on imported oil-seed cake, the oilseeds being shipped in (such as cottonseed), the oil extracted and the residue fed to livestock. Absence of such imports in 1940 compelled the slaughter of many cattle and further reduced the source of fat supplies, particularly butter. The war also practically stopped the operations of Norwegian and German whaling ships, which were a source of supplies of marine oils for oleomargarine and cooking fats. Data on food production and stocks are considered military secrets in a number of countries and such information is often unobtainable or of doubtful authenticity. For conservation purposes Italy pooled olive oil stocks and it was announced that 1940 production was about 300,000 short tons. Since the ten-year average of olive oil production in Italy is only 222,400 short tons, the 1940 estimate may be considered at least highly optimistic, particularly in the light of comparable Spanish production. Spain forbade olive oil exports in 1940 because of a shortage in production, estimated at 297,000 short tons, compared with 352,000 short tons in 1939 and a five-year average of 453,200 short tons. (For comparable data on oils, fats, sugar, bread grains and other food in Europe see "A Review of the Food and Feed Situation in Continental Europe," *Foreign Crops and Markets*, vol. 41, no. 14, Oct. 14, 1940, U.S. department of agriculture.) In the Americas and in tropic countries wartime restrictions resulted in large accumulations of oil foods and feeds, particularly coco-nut, cottonseed and pork products.

Venereal Diseases. The end of the year 1940 in the national venereal disease control pro-

gram found every state health department in the United States organized for the control of syphilis in the civilian population and ready to assist in protecting men concentrated in military areas against venereal diseases. Federal funds totalling \$8,080,000 made available in 1939 and 1940 under the Venereal Disease Control act, plus approximately \$10,300,000 from state and local sources, enabled health authorities to put into operation machinery for the control of the venereal diseases.

The expansion of activities is demonstrated in the annual reports of state health departments from 1937 through 1940. The table shows the number of syphilis cases reported to state health departments, the serologic tests performed for the detection of the disease, the doses of arsenical drugs distributed by health departments and the number of venereal disease clinics in operation.

Syphilis Cases Reported to State Health Departments, 1937-40

Fiscal Year	Syphilis Cases	Serologic Tests	Doses of Arspenamine	Clinics Operating
1937	336,258	2,618,159	1,567,348	1,380*
1938	480,140	3,598,198	2,790,110	1,746
1939	485,967	5,588,285	4,677,285	2,405
1940	487,494	10,216,978	6,895,837	2,887

*Estimated, these data being unavailable.

The growth of the organization for case-finding is shown in the annual increase in number of blood tests for syphilis. While the syphilis cases reported remained fairly constant following the intensive case-finding program of 1937 and 1938, the reported amount of arsphenamine distributed increased more than 300% from 1937 to 1940. The doubling of the number of clinics during the same period is significant of the attempt to make diagnostic and treatment facilities accessible to all sections of the population. Solution of this problem has advanced to the point where mobile clinics go to the patients in eight rural areas of the south and southeast. Trailers with complete medical equipment cover as much as 500 mi. and hold as many as 24 clinic sessions in one week.

The clinics' need of a fast, accurate accounting system to determine the treatment status of their patients has been met in more than 1,000 of them by a mechanical reporting system. Twelve central tabulating units covering over 200,000 cases in 25 areas provide clinic directors with current morbidity reports and a means of rapidly selecting individual patients in need of special care.

Efforts to prepare standard treatment procedures and to evaluate new drugs and techniques for the treatment of the venereal diseases continued.

The treatment for syphilis known as the "five-day" or "intravenous drip" method, which has been under investigation for several years at Mt. Sinai hospital in New York city, was being tried out at several additional treatment sources in 1940. The hope offered by this massive dosage through constant dripping of the drug into the blood stream is a shortening of the treatment period which under the standard method of administering smaller divided doses of arsenicals continues 18 to 24 months. A technique in which as much of an arsenical is administered in five days as usually is given over a three-month period would be of particular value in shortening the infectious period of early syphilis. This method of treatment was still in the experimental stage, however, in 1940, and long observation will be needed before conclusions on the value of the five-day treatment can be reached.

A study of the relative effectiveness of artificial fever mechanically induced compared with the older method of clinically induced malaria fever in the treatment of paresis was made by clinics co-operating with the United States public health service. Investigators determined that both types of fever treatment combined with chemotherapy secured good results, the proportion of remissions being dependent on the degree of impairment at the beginning of fever therapy.

At the beginning of the national program, health authorities concentrated on syphilis control because they lacked an effective weapon for conducting a mass attack on gonorrhoea. With the introduction of the sulphonamide compounds for the treatment of this disease, activities directed toward the control of gonorrhoea were being pushed forward. Probably no drug has become so universally used by the general practitioner in so short a time as sulphanilamide and its derivatives. The tablets distributed by health departments increased from 3,500,000 to 6,000,000 since 1938. Studies undertaken jointly by the United States public health service and the American Neisserian Medical society show that the period of communicability of gonorrhoea is considerably shortened by the use of the sulphonamide compounds.

Among other activities continued in 1940 were public education and the seeking of state legislation related to venereal disease prevention. An indication of the educational activity in printed, motion picture, radio and graphic information was the 1,500,000 published pieces on venereal diseases sold in the fiscal year of 1940 by the government printing office to public and private health agencies and to individuals. Questionnaires to determine how much the public has learned about venereal disease control have been filled out by more than 40,000 persons.

Twenty-four states have enacted laws requiring blood tests for syphilis of all applicants for marriage licences, and the legislatures of several others are expected to consider similar action in their 1941 sessions.

The great national task of 1940 was the initiation of rearmament. While such agencies as the American Medical association, the U.S. army and navy medical corps and the U.S. public health service joined in a movement to co-ordinate medical services and to bring about health preparedness,

venereal disease control officials in these and other groups formulated plans to meet the threat of the venereal diseases to the military and industrial forces of the nation. Records show that the venereal diseases were the third greatest cause of days lost in the U.S. army during the World War of 1914-18, being surpassed only by influenza and battle casualties.

Health authorities agreed on a co-operative venereal disease control policy for military and key industrial areas. The Wisconsin state board of health with federal, military and local co-operation gave an example of what could be done in walling off civilian venereal disease contacts surrounding military camps. Policing to prevent "camp-follower" trailers, itinerant amusement places and prostitutes from coming into a 1,000-sq.mi. area during the Aug. 1940 war games of the 6th corps area produced a phenomenally low rate of infection among the troops. Of 59,750 soldiers only 78 were admitted for venereal disease treatment and only four cases (all gonorrhoea) were traceable to infections within the area.

Probably the greatest single step in venereal disease defence activity was the regulation adopted by the national selective service board requiring serologic tests for syphilis on all men, 21 to 35 years old, as they appear before their local draft boards. State and local health authorities made laboratory facilities available for making these tests. The significance of the regulation may be understood from statistics showing that 80% of early infectious syphilis is concentrated in the 15-30 age group. (See also CHEMOTHERAPY.)

Venezuela, a federal republic in northern South America; language, Spanish; capital, Caracas; president, General Eleazar López Contreras. The area is 393,976 sq.mi.; the population by the 1936 census was 3,467,839, including 103,492 Indians. The principal cities, with their 1936 populations are: Caracas, 203,432 (1940 estimate: 260,000); Maracaibo, 110,010; Valencia, 49,214; Barquisimeto, 36,429; Nirgua, 30,706; Carúpano, 30,163; Maracay, 29,759; Río Caribe, 29,696; Boconó, 25,315; Ciudad Bolívar, 25,134; Puerto Cabello, 22,213; San Cristóbal, 21,874; Cabimas, 21,753; Cumaná, 21,623; La Victoria, 21,372. La Guaira, port of Caracas, has a population of 9,717.

History.—During 1940, Venezuela continued politically orderly and stable. The municipal and state elections of November gave heavy majorities to President López Contreras' "Bolivarian party." Municipal councillors and state legislators jointly elect the national congress and political interest centred about that body's selection of a successor to López Contreras in the forthcoming presidential elections of April, 1941.

Economically the country was under some strain in the latter part of the year, due to European war effects upon her foreign markets, particularly in the Netherlands and the Scandinavian countries. Exports, especially of petroleum, suffered a sharp decline. In October, after the bolívar had sagged in international exchange from an approximate 31 cents (in terms of the U.S. dollar), maintained from 1933 to July of 1940, to 25 cents, the government established an Import Control commission, restricting and licensing imports. Even at the new figure the bolívar was higher in dollar terms than in 1932.

Education.—Primary education is compulsory and under control of the federal government. There are over 6,000 primary schools, 50% more than in 1938, with around 250,000 pupils, 11 normal schools, 51 public and 24 private secondary schools and two national universities (at Caracas and Mérida). Preparations were under way in 1940 for an industrial university at Maracaibo.

Trade and Communication.—In normal times Venezuela enjoys unusually extensive external steamship communications, but these were materially curtailed by European war conditions. The leading ports are La Guaira and Maracaibo, although several oth-

ers are important. External air communication was improved, however, during 1940, as the Pan American Airways increased its service from Central and North America and the East Coast of South America. The Royal Dutch Airways connects Caracas with Curaçao, while internal communication is maintained by a government-sponsored line.

There are 563 mi. of commercial railway and a 6,000-mi. highway network. These are supplemented by some 6,500 mi. of navigable rivers, especially in the Orinoco basin, where transportation is largely fluvial.

The main telegraph (7,886 mi.) and telephone (600 mi.) systems are government-owned. Since 1934 the number of telephones has increased 90%. There are 24 long-wave and 27 short-wave broadcasting stations, all but one being government-operated.

In 1939 exports totalled \$297,917,389 (a 7.4% increase over 1938), imports \$101,484,944 (a 4.4% increase). Curaçao took approximately 74% of exports (entirely petroleum), the United States 14%. The latter supplied 57% of imports. Imports are chiefly machinery, textiles and foodstuffs. In the first half of 1940 imports increased by 7%. Petroleum comprises around 90% of all exports (88% in 1939), but since practically all oil properties are in foreign hands, only an estimated 20% of all exports actually accrues to the country. Coffee provides from a third to one half of other exports (4% in 1939). Heavy reduction in petroleum exports in the second half of 1940 seriously threatened the national economy.

Production.—Venezuela is normally the world's third largest petroleum producer, accounting for nearly 10% of all production. In 1939, 208,070,000 bbl. were produced (1940 est.: 189,210,000 bbl.). Coffee, second export commodity, has been seriously affected by the European war. Government loans to assist growers to carry the crop were necessary in 1940. The Inter-American Coffee Quota agreement of Nov., 1940, however, gave promise of at least a stabilized market. Under it Venezuela was allotted 420,000 bags for export to the United States, 2½ times the actual 1938 total.

Finance.—The monetary unit is the bolivar (value: 25 cents U.S.). The national debt is less than 3,000,000 bolivares (2,648,968 in 1938), all of it internal, and is probably the smallest per capita in the world. In 1939 treasury receipts approximated 350,000,000 bolivares, expenditures 380,000,000.

BIBLIOGRAPHY.—Edna Fergusson, *Venezuela* (1939); Henry J. Allen, *Venezuela: A Democracy* (1940). (L. W. BE.)

Verdier, Jean (1864–1940), French cardinal and archbishop of Paris, was born in Lacroix-Barrez, France, in Feb. 1864. He was educated in the Sulpician schools and colleges and was ordained priest in 1887. He was a professor for 40 years in the Sulpician seminary in Paris; in 1929 was elected superior general of the Sulpician order, and on Nov. 19 was appointed archbishop of Paris. Less than a month later he was made a cardinal. He visited the United States in 1923 and again in 1932. He actively supported the Allies after war broke out in 1939 and insisted they were "struggling for the freedom of people throughout the world." He died in Paris, April 9.

Vermont, fourteenth state of the United States, a north Atlantic state, first to be added to original thirteen, popularly known as the "Green Mountain State"; area, 9,564 sq.mi.; population, according to 1940 census figures, 359,231. This was 380, or one-tenth of 1%, less than the 1930 count. The urban population increased 3.8%, the rural declined 2%. Most of the urban gain was in the small cities, at the expense of the rural areas and larger cities. Of the state's three cities of over 10,000 population only Burlington gained, showing an increase from

24,789 to 27,686. Eight counties lost population, Caledonia showing the largest loss; and six gained, Chittenden showing the largest increase.

History.—A total presidential vote of 143,044 was cast in the state: Willkie 78,371; Roosevelt 64,269. William H. Wills was elected governor; Warren R. Austin and George D. Aiken, U.S. senators; Charles A. Plumley, representative to congress; Mortimer R. Proctor, lieutenant-governor; Thomas H. Cave, state treasurer; Rawson C. Myrick, secretary of state.

Education.—The public school system of the state is under the supervision of a state commissioner of education and local

union superintendents, the revenues being derived mainly from state and local taxes. School interests advocated an increase in the minimum base pay of rural school teachers, a gradual increase from \$15 to \$20 per equated pupil in state support of schools, a \$10,000 increase in the appropriation for vocational education. There are six colleges and universities in the state, three junior colleges, two state normal schools and a state agricultural school.

Charities and Correction.—The charitable

and corrective institutions consist of a state prison and women's reformatory, industrial school, two hospitals for the insane, a school for feeble-minded and a home for children. Erection of a state sanatorium with a capacity of 150 patients in connection with one of the state hospitals for the insane was recommended to the 1941 legislature. Building and improvement needs, totalling \$500,000, at the state prison were also being agitated.

Finances.—The state treasury reported state finances to be in excellent condition. The state planning board survey reports indebtedness of Vermont cities, towns and incorporated districts increased only \$262,351.01 between 1932 and 1938, compared with a sharp \$8,810,458.71 jump in the previous 12-year period between 1920 and 1932. The state tax department reported receipts during 1940 of \$806,129.20 from the state income tax to be a record-breaking total, exceeding the 1939 total by \$87,622.46 and the previous peak, reached in 1938, by \$47,636.56. Motor vehicle fees also reached a new high during the year.

Industries.—The industries of the state raised their production level during 1939–40. Employment tax returns from 15 representative industries indicated that the number of their employees has increased about 51% since 1938 and salaries paid have increased about 89%. The increase from 1939 to 1940 was larger than from 1938 to 1939. In the recreation field winter sport activities were still expanding. State officials estimated that \$500,000 were invested by public and private agencies in new winter sports developments for the 1940–41 season. For statistics see also ALFALFA; APPLES; BARLEY; BEANS, DRY; BUCKWHEAT; CORN; FARM MACHINERY; GRAPES; HAY; MAPLE SUGAR; OATS; PEARS; POTATOES. (L. W. D.)

WILLIAM H. WILLS, Republican, elected governor of Vermont Nov. 5, 1940

Veterans' Administration. The summation in Table I shows the number of veterans

VETERANS OF FOREIGN WARS

Table I.—U.S. Veterans and Dependents Receiving Benefits, June 30, 1940

War	Living Veterans	Deceased Veterans	Total
War of 1812		I	I
Mexican		130	130
Indian	2,216	4,055	6,271
Civil	2,381	50,141	52,522
Spanish-American			
Service connected	1,584	1,325	2,909
Non-service connected	157,559	50,337	213,896
Special acts	87	58	145
Total Spanish-American	159,230	57,720	216,950
World War (War Time)			
Service connected	348,164	99,479	447,643
Non-service connected	60,296	17,524	77,820
Total World War	408,460	117,003	525,463
Regular establishment	36,051	10,126	46,177
Grand total	608,338	239,176	847,514

and deceased veterans whose dependents were receiving pension or compensation benefits as of June 30, 1940.

Hospital and Domiciliary Care.—As of June 30, 1940, 56,841 beneficiaries were receiving hospital care and 16,518 were receiving domiciliary care authorized by the Veterans' administration.

Of the number under hospital care, 4,703 were receiving treatment for tubercular ailments, 33,041 for neuropsychiatric diseases, 19,097 for general medical and surgical conditions.

Of those under domiciliary care, 304 were being treated for tubercular ailments, 4,753 for neuropsychiatric diseases and 11,461 for general medical and surgical conditions.

Table II.—Fiduciaries Under Supervision, by Types, June 30, 1940

	Incompetents		Minors	Total
	Veterans	Others		
Fiduciaries acting for wards of all wars:				
Guardianship for	38,375	4,396	16,639	59,410
Legal custodians for	43	81	9,397	9,521
Institutional awards	597	..	..	597
Total	39,015	4,477	26,036	69,528
Wards of all Wars	39,015	4,477	40,284	83,776

Insurance.—As of June 30, 1940, benefits provided for under term and automatic insurance were being paid in monthly installments to 10,944 permanently and totally disabled veterans and to the beneficiaries of 12,258 deceased veterans. The disbursements for the above benefits during the fiscal year 1940 approximated \$19,601,577.

As of June 30, 1940, there were 608,923 United States government life insurance policies in force, having a face value of \$2,564,984,223.

As of the above date, monthly payments were being made, from the United States government life insurance fund, to 10,622 permanently and totally disabled veterans.

Table III.—Total Disbursements to June 30, 1940

Compensation and pensions:	
World War	\$ 4,093,677,706.20
All other wars	9,851,330,412.67
Regular establishment	186,074,145.00
Payment to participants in yellow fever experiments	103,613.75*
Military and naval insurance	2,147,001,479.67
U.S. government life insurance	448,191,523.77
Adjusted service certificates	3,749,112,741.40†
Adjusted service and dependent pay	54,067,708.63
Loans to veterans for transportation	70,103.36
Hospital and domiciliary facilities and service (Constr.)	115,606,205.25
Vocational training	644,880,710.28
Allotments and allowances	582,941,081.16
Marine and seamen's insurance	35,078,013.20
Salaries and expenses (general administration)	2,055,244,831.79
Administrative expenses, Adjusted Compensation Payment Act, 1936	3,695,743.02
Printing and binding	2,225,327.69
National Industrial Recovery Act, V.A. 1933-39	3,018,704.79
Public Works Administration Act of 1938 (Allotment to V.A.)	12,014,254.28
1938-1940	21,742.33
Horatio Ward fund	1,716,100.52
General Post fund	693,814.32
Funds due incompetent beneficiaries	10,182,446.89
Personal funds of patients, V.A.	1,067,635.10
Miscellaneous	..
Total	\$23,999,282,045.97

* Disbursements from June 30, 1931, to June 30, 1940.

† This amount represents payments made on adjusted service certificates and amounts reimbursed to the U.S. government life insurance fund on account of loans made from that fund on certificates under the provisions of the World War Adjusted Compensation Act as amended, and the Adjusted Compensation Payment Act, 1936.

Emergency Officers' Retirement Pay.—As of June 30, 1940, there were 1,784 emergency officers receiving retirement pay for disabilities incurred during the World War. The annual disbursement for this form of benefit during the fiscal year 1940 approximated \$2,936,259.

Guardianship.—The Veterans' administration, in order to safeguard all monies paid by the government in the form of pensions and compensation to incompetent or minor beneficiaries, maintains a close supervision of all guardianship activities.

The summation in Table II shows the number of fiduciaries under supervision as of June 30, 1940, subdivided by types of beneficiaries.

Disbursements.—Table III does not include loans made to veterans secured by U.S. government life insurance policies.

The total amount includes \$1,251,263,333.79 made available by deduction for allotment from the pay of World War veterans while in service, from amounts collected as premiums on the various forms of government insurance, and amounts in other trust funds. (See also ADJUSTED COMPENSATION.) (F. T. H.)

Veterans of Foreign Wars.

The fiscal year of the Veterans of Foreign Wars of the United States, ending Sept. 1, 1940, featured marked progress in its legislative, veteran welfare and Americanism programs.

During the year 1939-40, and for the ensuing year, the activities of the Veterans of Foreign Wars of the United States have been rededicated to the achievement of three principal objectives. These were outlined by Commander-in-chief Otis N. Brown, Greensboro, N.C., in his keynote speech to the 1940 national encampment, as follows:

"First, a national defence structure that will enable the United States to surround the western hemisphere with an insurmountable wall of protection against invasion either from the east or the west; second, a constant program of patriotic education that will expose the evil ambitions of subversive groups within our population and give greater emphasis to the blessings we enjoy as citizens under a government that exists for the benefit of the people; third, encouragement of those social, political or economic reforms that may be necessary to strengthen our democracy, to make it more efficient and more capable of dealing with conditions which create poverty, discontent and disloyalty."

"One Nation Indivisible" was the theme upon which virtually every phase of the V.F.W. program was based during the 12 months. This principle, in the words of the oath of allegiance to the American flag, dominated the 41st annual national encampment August 25-30, at Los Angeles, Calif. It was the guiding motif of local V.F.W. programs on patriotic occasions and it was the basis of the intensive Americanism and national defence activities sponsored by local posts throughout the country. As an educational feature of its Americanism program, the V.F.W. promoted the display of approximately 12,000 24-sheet billboard posters on signboards in every state, proclaiming "foreign 'isms' can't divide Americans—united we stand!—one nation indivisible with liberty and justice for all."

As an example of its educational activities in support of Americanism, the Veterans of Foreign Wars of the U.S., in co-operation with its ladies' auxiliary, sponsored a nationwide essay contest for high school students during 1939-40 on the subject "The Benefits of Democracy." More than 100,000 students submitted essays in competition for \$2,000 in cash prizes. The first prize of \$1,000 in cash was awarded to 17-year-old Sam Cooper, Omaha high school senior, son of an immigrant.

The year also marked enactment, by the national congress, of a number of major veteran welfare laws instituted or supported by the V.F.W. One of these was the so-called Philippine Travel Pay bill providing for the payment of certain emoluments to Spanish-American War veterans owed them by the government since 1900. Another increased the pensions of approximately 30,000 World War widows whose husbands died of service-connected

disabilities, from approximately \$30 to approximately \$40 a month each. Another liberalization of veteran laws was embodied in a veterans' administration ruling providing that total disability ratings may henceforth be applied to many cases not previously allowable.

Concerning its own part in the nation's defence plans, the V.F.W. has volunteered its entire membership, individually and collectively, for service whenever and wherever needed. Its members are particularly qualified for service in home defence units, in training younger men for military service and to serve on conscription boards. The V.F.W. also, as a result of a mandate of its Los Angeles convention, inaugurated a plan by which national defence committees would be organized in each V.F.W. state department for the purpose of intensifying co-operation with constituted authorities in all national defence activities and preparations.

Officers elected for 1940-41 include Dr. Joseph C. Menendez, New Orleans, La., commander-in-chief; Max Singer, Brighton, Mass., senior vice commander-in-chief; Robert T. Merrill, Havre, Mont., junior vice commander-in-chief; R. B. Handy, Jr., Kansas City, Mo., adjutant-quartermaster general; John L. Sullivan, Phoenix, Ariz., judge advocate general; Dr. William D. Ryan, Detroit, Mich., surgeon general; the Rev. E. F. Austin, Richmond, Calif., national chaplain; Carl J. Schoeninger, Detroit, Mich., inspector general; R. E. Kernodle, Kansas City, Mo., national historian. (B. Y.)

Veterinary Medicine.

A fatal disease of foxes and minks manifested by tonic spasms of the voluntary muscular system was shown to be a vitamin-B₁ deficiency by the researches of R. G. Green, M.D., professor of bacteriology, medical school, University of Minnesota, and his associates, Dr. C. A. Evans and W. E. Carlson. The disease was named Chastek paralysis, for the Minnesota fox ranch on which the discovery was made. Its nature had baffled the most capable investigators for years. It occurs mainly during the late winter months and invariably follows the feeding of uncooked fish as part of the ration on fox farms. Carp, quillbacks, Atlantic coast whiting and several other species of fish have caused serious outbreaks of the disease. Chastek paralysis can be experimentally produced with precision by feeding a diet containing whole, uncooked fish, and it can be prevented or corrected with equal precision by giving adequate doses of thiamin hydrochloride or by feeding a ration rich in vitamin B₁.

Although Chastek paralysis appeared to be an avitaminosis, since infectious factors were ruled out by examination and experimental study, the results of experimental feeding were puzzling on account of their irregularity, until it was discovered that direct contact with the ground often gave the animals opportunity to obtain something that prevented the deficiency. With foxes in raised, wire pens, it was determined that each pound of fresh carp required about 2,000 units of crystalline vitamin B₁ added to the diet.

Vaccinating Hogs against Cholera.—The popular method of vaccinating swine against cholera discovered by Dorset, Niles and McBryde shortly after the turn of the century was replaced to a certain extent by the use of a chemically modified virus developed by Wm. H. Boynton in the research laboratory of the University of California.

The new vaccine confers immunity without producing the depressing reaction following the standard method and overcomes the spreading of the disease by vaccinated hogs. The immunity conferred by the Dorset-Niles-McBryde method is solid and durable, but because it requires the use of a highly-virulent virus, the discovery of a harmless virus of equal immunizing value aroused the interest of veterinarians and swine breeders, some of whom discarded the old method during 1940.

Brucellosis of Cattle.—This insidious disease of cattle, commonly called contagious abortion or Bang's disease, occupied more than usual attention in 1940 due to a mitigation in the controversial matter of applying certain control measures in combating the disease. The "test and slaughter" method, popularly recognized and universally employed as the medium of bovine tuberculosis eradication in the United States and Canada, was applied in 1934 as a means of removing an apparent surplus in dairy cows and has been conducted since as a step toward a more complete control of the malady. During the same period, studies have been in progress on a rather large scale for the purpose of determining the potential possibilities of a comparatively safe method of preventive vaccination with a viable vaccine developed from a low virulent culture of the *Brucella* organism in the laboratories of the bureau of animal industry. Analogous tests of this material were also car-

ried out in the University of California in addition to studies in other similar institutions and by many other research workers. The encouraging and favourable results reported created an enthusiastic eagerness among those directly connected with the industry in the hope that an adjunct had been discovered which would permit control of the disease in instances where the destructive features of the slaughter plan are less applicable to the situation. That portion of the industry whose herds had been freed of the disease and who were in constant fear that the disease might again strike with devastating effect were also focusing attention on vaccinal developments.

Rabies.—At the annual meeting of the American Veterinary Medical association compulsory vaccination of dogs was disapproved, pending a more general agreement as to its immunizing value. Single-dose vaccination of dogs with commercial rabies vaccine was recommended when used concurrently with other control measures, particularly the systematic disposal of stray dogs, isolation and quarantine.

Swine Erysipelas.—The spread of swine erysipelas over wider areas has caused anxiety among swine breeders in recent years. Its importance in swine production, meat packing and public health was discussed at length in a symposium on the subject held in connection with the 77th annual meeting of the American Veterinary Medical association at Washington, D.C. Although the disease in man is generally a somewhat benign local infection contracted in the handling of meat and fish, it is a depressing and often fatal disease in swine that is capable of causing great losses where enzootic outbreaks occur.

The septicæmic or European type of the disease, formerly rare in the United States, has become more prevalent in recent years and was in 1940 regarded as a threat to the swine-breeding industry.

Preventive vaccination by means of living cultures of the specific micro-organism injected simultaneously with hyperimmune serum has not been approved by the bureau of animal industry on account of the possible danger of spreading the infection when used in the absence of professional supervision, although experiments in the field with this method of vaccination were in progress in 1940. Only the use of antiserum, which confers but transient passive immunity and has limited curative value, was permitted in 1940.

Phenothiazine.—Among the noteworthy developments of 1940 was the discovery of the remarkable benefits derived from the use of phenothiazine in the treatment of farm animals parasitized with intestinal worms. Extensive experiments conducted under the direction of the U.S. bureau of animal industry since 1938 and its use on a large scale in horses, cattle, sheep and swine have established the unusual anthelmintic property of this chemical and its relative harmlessness which are the two properties representing the ultimate objective of animal helminthology. Although phenothiazine was discovered in 1885 and its destructive action against the larvae of certain insects was known since 1934, its value as a remedy for intestinal worms in farm animals became known in 1940. As worm parasites of the stomach and intestines are extremely harmful in animal production and the remedies previously available are toxic, the discovery of a drug that expels worms from the alimentary tract without inflicting any damage to the host is exceedingly important in the practice of veterinary medicine. Facts as to its therapeutic merits and its remarkable safety were proved on the large swine-breeding farms of the United States and in the vast sheep herds of Australia.

In addition to meeting the specifications of a true anthelmintic, the low price conforms to the economics of livestock production. Worthy of note is the proved but unexplained fact that phenothiazine is of no value as a vermifuge in carnivorous animals.

Poultry Practice.—A remarkable increase in the application of scientific poultry medicine appears to mark 1940 as the starting point of long-delayed reforms in the prevention and treatment of the four or five deadly contagious diseases which have curtailed poultry and egg production. In round numbers the poultry of the United States is valued at \$1,000,000,000, from which 25% was marked off annually on account of losses from diseases that are largely preventable. The World's Poultry congress of 1938 which drew an attendance of 850,000 to Cleveland, O., devoted a day to the discussion of the disease problems responsible for these tremendous losses. Neglect of poultry medicine by the members of the veterinary profession engaged in rural practice, and the habitual tendency of poultrymen to depend upon nostrums of little medicinal value as a consequence, was ably emphasized by Professor Emeritus James E. Rice, Cornell university.

Biological Products for Animals.—A notable event of 1940 was the renaming of many of the biological products employed in the preventive treatment and diagnosis of animal diseases. As of June 30, 1940, the United States bureau of animal industry, which is charged with the granting of licences for such products, published in Notice 162-A the nomenclature that would thereafter be accepted. The object was to avoid the use of deceptive names for products that are not specific for a given disease and to remove inferior ones from the channels of trade. Only definitely specific agents may now be named for the disease for which they are employed. "Rabies vaccine," "tetanus antitoxin," etc., are examples of approved names. Such vague terms as "calf scours serum," "abortion vaccine," and many others were abolished and the products renamed for precisely what they contain.

About 90 different biologic products were in use in 1940 and many of them were stored in large quantities throughout the country to meet current emergencies. Permission was granted to dispose of many of these biologics under their old names until Dec. 31, 1940.

Meat and Milk Inspection.—The removal of unwholesome meat, milk and poultry from the channels of trade ranked among the important projects of the veterinary service. Although a large percentage of animals and animal products destined for human use is inspected by the federal government and careful tradesmen look for the stamp of approval on market meat, local abattoirs may sell uninspected meat within the state. Trucking and improved highways can invite wide distribution of unfit meat and meat products. As a consequence, states and municipalities were in 1940 installing veterinary services to supervise the slaughtering of animals not federally inspected.

Vicalloy: *see* METALLURGY; TELEPHONE.

Vichy. A town of central France, department of Allier, on the right bank of the Allier, 33 mi. southeast of Moulins; population (1939) about 20,000. Vichy was known primarily as a medicinal spa until the summer of 1940, when it became the temporary capital of the French government, which was unable to return to Paris because of the German occupation. Vichy was in the unoccupied part of France, and one reason for its selection as a seat of government was that it possessed a considerable number of hotels which could be requisitioned and reserved for the use of government officials. The French government which was established in Vichy was headed by Marshal Henri Philippe Pétain as chief of state.

The waters of Vichy were known in the days of the Romans and their fame was revived in the latter part of the 17th century. The waters, which are limited, have an alkaline taste and are recommended for diseases of the stomach and the liver, especially for diabetes and gout. "Vichy" is one of the best known French mineral waters, and considerable quantities are bottled and exported. The town was one of the most fashionable and popular French health resorts and was provided with a casino, a park and many luxurious hotels. (W. H. CH.)

Victoria. A state of the Australian commonwealth, area 87,844 sq.mi.; pop. (est. Dec. 31, 1939), 1,887,278. Chief towns (pop. Dec. 31, 1939): Melbourne (1,046,750); Geelong (40,100); Ballarat (38,590); Bendigo (30,150). Governor, Maj. Gen. Sir W. J. Duggan, K.C.M.G., C.B., D.S.O.

History.—Mr. Dunstan's government, the first Country party administration in Australian history, was returned at the general election which was held in March 1940. The only change in the respective strength of the parties was that the United Australia party opposition lost two seats, one to labour and one to an independent. The government continued in office, supported by the Labour party, the largest single party in the legislative assembly. At the legislative council elections held in June only 8 of the 17 provinces were contested.

The state accounts for 1939-40 disclosed a surplus of £6,000 and were largely in accord with budget estimates. The budget for 1940-41 provided for an estimated surplus of £3,000. No new taxation was imposed and a reduction of the unemployment relief tax by 15% was announced.

Consequent upon the speed-up in armament production and the construction of new munition factories, business was buoyant. Seasonal agricultural and pastoral prospects were fair.

Dr. W. R. N. Maloney, M.P., one of the most popular figures in the political and medical life of Australia, died on Aug. 29, 1940. He had enjoyed a parliamentary career of more than 50 years and had represented Melbourne in the federal parliament since 1904.

Finance.—In 1938-39: Revenue £A26,986,000; expenditure

£A27,773,000; debt outstanding (June 30, 1939) £A179,698,118.

Communications.—Roads and streets fit for motor traffic (Sept. 30, 1938) 104,004 mi. Railways (1938-39) 4,767 mi. Motor vehicles licensed (1938-39): cars, trucks, etc., 234,719; cycles 26,698. Wireless receiving set licences (Dec. 31, 1939) 339,652. Telephones (June 30, 1939) 208,230.

Agriculture, Manufactures, Mineral Production.—Production in 1939-40: wheat 45,055,000 bu.; wool 165,829,182 lb.; coal, brown (1939) 3,651,014 tons; gold (1939) 156,522 fine oz. Industry and labour, 1939-40: factories 9,250; employees 201,831; gross value of output £A152,967,611; unemployment (trade union returns) (June 1940), 6.6%. (W. D. MA.)

Virginia, the most southerly of the middle Atlantic group of states and one of the original states of the United States, popularly known as "The Old Dominion"; first settled permanently in 1607; area 42,627 sq.mi.; population according to 1940 U.S. census, 2,677,773, which is 10% larger than in 1930; capital, Richmond, 193,042; and seaport, Norfolk, 144,332.

History.—James H. Price was governor in 1940; Saxon W. Holt, lieutenant governor, died in 1940. The 1940 general assembly passed a constructive group of measures increasing appropriations for public education and welfare, bringing the Unemployment Compensation act in conformity with recent federal legislation, establishing premarital examinations, providing a comprehensive mining code, and taking steps toward eliminating pollution in Hampton Roads and Potomac river areas. Bills introduced at this assembly to integrate Virginia's penal system, to make probation effective and provide for parole of felons, to place county sheriffs and city sergeants on salaries, to encourage mediation and conciliation of labour disputes, to establish a state personnel system and to create an actuarially sound retirement plan for teachers were not passed.

In the 1940 national election Virginia gave Roosevelt 235,961 votes, Willkie 109,363. Harry F. Byrd was returned to the senate; all nine Democratic candidates were elected to the house of representatives.

Education.—The 1940 census recorded 712,081 children between seven and 19, inclusive, for whom Virginia has a free school system which is compulsory for all between seven and 15 years. Physical training is obligatory; whites and Negroes have separate schools. Public school membership was 593,231 in the 1939-40 session for which total disbursements, including capital outlay of \$5,366,567.31 and debt service of \$2,398,203.65, were \$31,466,398.68.

Public Welfare and Health.—Total state expenditures on public welfare for year ending June 30, 1940 were \$8,968,123.14, 9.65% of total state expenditures. About 11% of population, 292,795, were registered for relief or welfare service. The state spent \$1,301,415.53 on penal institutions; \$272,820.52 on industrial schools; \$2,572,799.79 on mental institutions and \$4,821,087.30 on non-institutional activities—public assistance, confederate pensions and criminal expenses. State, federal and local funds for public assistance in Virginia amounted to \$4,262,641.98, including cost of administration.

At the close of the 1939-40 fiscal year, 18,192 were receiving old-age assistance. For the same period 29 rural health departments served 45 counties having 62% of Virginia's rural population. State expenditures on public health were \$2,338,158.98, 2.52% of total state expenditures.

Banking and Finance.—Jan. 1, 1940, Virginia had 185 licensed state banks and 130 national banks. Total assets of state banks, \$289,184,000; of national banks, \$438,434,000; combined total assets, \$727,618,000. Combined liabilities of state and national banks included aggregate deposits, \$635,325,000; capital stock, \$44,581,000; surplus, \$26,852,000; undivided profits, \$10,044,000. June 30, 1940 cash balance in state treasury, \$10,696,415.73; unobligated surplus, \$3,713,645.59; gross bonded debt, \$19,515,732.02; assets in sinking fund, \$4,755,363.41; net debt, \$14,760,368.61; no floating debt. Revenues and expenditures for fiscal year 1939-40 were \$96,234,587.88 and \$92,939,671.77, respectively.

Agriculture and Manufacturing.—Estimated 1940 total farm income was 5% higher than 1939. Total value of crops increased 4%, estimated at \$101,017,000 in 1940 as compared with \$97,123,000 in 1939. There were 3,791,000 ac. of principal crops harvested. Corn, the leading crop both in acreage and value, had an estimated yield of 26.5 bu. per acre, the highest on record. Forecast of crops and their value, Dec. 23, 1940: bales: cotton, 25,000, \$1,118,000; bushels: apples (commercial), 10,325,000, \$6,711,000; barley, 2,376,000, \$1,331,000; buckwheat, 195,000, \$146,000; corn, 36,490,000, \$28,097,000; cowpeas, 100,000, \$150,000; oats, 1,932,000, \$927,000; peaches, 1,392,000, \$1,392,000; pears, 525,000, \$289,000; potatoes, 10,412,000, \$6,351,000; rye, 576,000, \$420,000; soybeans, 480,000, \$408,000; sweet potatoes, 3,875,000, \$2,906,000; wheat, 8,463,000, \$7,278,000; pounds: peanuts, 196,800,000, \$6,691,000; tobacco, 97,540,000, \$15,048,000; tons: tame hay, 1,252,000, \$15,149,000. There were 126,530 ac. devoted to truck crops valued at \$10,001,000. In 1939, 2,444 manufacturing plants reported to the department of labor and industry; their total wages, \$152,217,950, were paid to 175,592 persons, the average number of wage earners; cost of their materials was \$629,111,530; and the value of their products, \$1,101,351,198.

(J. S. Br.)

Virginia, University of. A state institution for higher education situated at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments; two academic—the college and department of graduate studies; and four professional—law, medicine, engineering and education. The institution has a productive endowment fund amounting to \$11,512,570, and received from the state an annual appropriation of \$847,795 (1939-40). The total budget for 1940-41 was \$2,930,443. The corporate name of the university is "The Rector and Visitors of the University of Virginia." In 1940 the faculty and officers numbered 414 (professors and instructors); the students 3,015 (119 women; 2,896 men). Number of books in the library, 338,535.

(J. L. N.)

Virgin Islands, a United States West Indian dependency east of Puerto Rico, comprising St. Croix, St. Thomas, St. John and smaller islands; language, English; capital, Charlotte Amalie (on St. Thomas); acting governor, Dr. Robert Morss Lovett. The area is 133 sq.mi. Government is administered by a governor appointed by the president of the United States, with legislative functions vested in the municipal councils of St. Croix and St. Thomas.

Provisional figures on the 1940 census, released late in the year, indicated an increase in population of the islands for the first time since their acquisition by the United States in 1917. In contrast to a 16% decline between 1917 and 1930, population rose 13.1% to 24,889. The white population, a third of which is alien-born, continued in substantially the same proportion as before (9%), but the proportion of Negroes (78.3% in 1930) dropped to 69%, as "mixed and other races" jumped from 12.5%

to 22%. The chief cities are: Charlotte Amalie, 9,801 (7,036 in 1930); Christiansted, 4,495 (3,767 in 1930); and Fredriksted, 2,498 (2,698 in 1930).

History.—The outstanding feature in Virgin Islands history during 1940 was its increasing importance as a major link in United States Caribbean defenses. Work was begun on a submarine base adjacent to Charlotte Amalie, while a new air base was planned for St. Croix. On Nov. 26 Lawrence W. Cramer, governor since 1935, resigned. In December considerable attention was focused upon efforts to open the islands, without restriction of United States immigration quotas, as a haven for financially independent European political refugees. The proposal was still under discussion as the year closed.

External communication is by steamer and Pan American Airways. In 1940 suspension of a British shipping line formerly serving the islands cut direct communication with New York city.

Agriculture.—In 1939 imports totalled \$2,487,805, and comprised manufactured goods, foodstuffs and fuel oil. The last, coming almost entirely from Curaçao and Venezuela, aggregated 20% of all imports. Around 60% of imports is of United States origin. Exports were \$1,558,523 in 1939, almost entirely to the United States. Rum (46.1%) and sugar (20%) were the principal export items.

Sugar production, the principal industry, is restricted to a quota of 8,916 tons.

Education.—In 1940 there were 26 public and private schools, with a total enrolment of 4,719 in 1939. In 1940, 13.4% of the inhabitants over 10 years of age were illiterate (16.1% in 1930). The ratio among Negroes was 14.8%; whites, 12.6%; others, 9.2%.

Finance.—The monetary unit is the United States dollar. A United States government subsidy to assist in defraying operating expenses is made annually.

Vitamins. Until recently riboflavin was considered a dietary essential only by reason of analogy. Evidence of the importance of this factor was derived almost entirely from laboratory experiments with animals. Later it was found that people whose diet lacked sufficient milk or meat, the two most important food sources of this factor, exhibit a condition of undernutrition which is curable with riboflavin. In 1938 the symptomatology and treatment of an entirely new disease called ariboflavinosis was described. Patients with this condition exhibit a typical fissure in each angle of the mouth. The lips have a reddened and denuded appearance. There frequently is a dermatitis about the nose, occasionally elsewhere on the body. It was reported in 1940 that certain conditions in the eye frequently occur in patients with riboflavin deficiency. Kruse, Sydenstricker, Sebrell and Cleckley examined patients with a slit lamp and found evidence of a vascularizing keratitis associated with photophobia, dimness of vision and other symptoms. Rapid improvement followed the administration of from 5 to 15 mg. of riboflavin daily. The observation that pathologic changes in the eye may occur in riboflavin deficiency suggested to the authors not only that some of the cases of keratitis of unknown origin may be successfully treated with riboflavin, but also that deficiency of this vitamin may be more widespread than it was supposed. In this connection Spies and his collaborators reported that riboflavin deficiency is so common in some areas of the southern part of the United States as to partake of the nature of an endemic disease. In evidence offered in support of a suggested minimum requirement for riboflavin of 2 mg. (obtainable in about one quart of milk), the opinion was expressed that riboflavin deficiency probably is more widespread than deficiency of any other vitamin in the human diet.

Williams and his collaborators at the Mayo Clinic, Rochester, Minn., reported further interesting observations of thiamin deficiency in man. Patients in an insane asylum were maintained under careful medical supervision on diets low in thiamin. There developed in these patients symptoms of weakness, lack of appetite and loss of enthusiasm, comprising in general a condition such as might be diagnosed as neurasthenia. There was no

peripheral neuritis, a fact which tends to confirm Mikeljohn's view that thiamin is concerned only with the oxidation of carbohydrate. These patients were considerably improved following the administration of small amounts of thiamin hydrochloride daily and further improvement occurred when the dosage was increased. From these results it was suggested that previous standard allowances for vitamin B₁ in the diet, usually from 300 to 400 international units daily, may be too low for optimum health.

Interest in the practical aspects of the vitamins in nutrition was intensified. The United States Food and Drug administration published in the *Federal Register* for Sept. 5, 1940, certain proposals for the labelling of vitamin-containing foods with the aim of enabling purchasers to use commercial products more intelligently. In another connection the suggestion was made that some processed foods such as white flour could well be improved by the addition of the essential vitamins and minerals found in whole grains. The council on foods and nutrition of the American Medical association approved of this proposal as a step in the interests of public health. White flour contains about 0.2 mg. of thiamin, 0.18 mg. of riboflavin and 3.7 mg. of nicotinic acid to the pound. The wheat from which the flour was made contains about 2 mg. of thiamin, 1.1 mg. of riboflavin, and 12 mg. of nicotinic acid. White bread contains from about 50 to 100 international units of thiamin to the pound loaf; whole wheat bread, 450 or more. Because cereals contribute so largely to the diet, upwards of 25% of the total calories consumed, it is evident that improvements in the nutritional quality of processed cereal foods should, if the program is properly carried out, redound to the benefit of the public. In Great Britain the program of improving white flour had already begun by 1940 and was discussed by Moran and Drummond and by numerous writers in the *Lancet*, *Nature*, and the *British Medical Journal*.

Among the numerous contributions to the growing knowledge of the vitamin B complex may be mentioned the announcement by Williams and Major of the chemical structure of a derivative of pantothenic acid and its synthesis. Pantothenic acid was produced by coupling the derivative α -hydroxy- β , β -dimethyl- γ -butyrolactone with β -alanine. This vitamin was shown to be capable of preventing or curing a type of dermatitis in chicks. The rat fed on rations deficient in pantothenic acid develops adrenal necrosis with haemorrhages in the cortex. This observation, together with the report by Morgan that young silver foxes placed on a ration lacking the anti-gray hair factor exhibited survival of the thymus, which had a red and mottled appearance, emphasizes that some of the vitamins may be inter-related with the endocrine systems of the body. Work on the vitamin B complex was progressing so rapidly that it is only by careful and persistent study of the scientific and medical literature that even an expert can keep up with the field. Reviews such as that of Lepkovsky are invaluable sources of technical information. An excellent summary of information about nutritional diseases in the United States, with particular reference to the vitamins, was contributed by Sebrell. Reports on the value of administrations of vitamin K to the mother, even a few hours before the birth of her child, in preventing intracranial haemorrhage of the newborn, were corroborated. On the other hand further studies on the uses of alphatocopherol in the treatment of muscular dystrophy or amyotrophic lateral sclerosis were not encouraging. Newer data on the vitamin content of foods were becoming available as methods for the estimation of the vitamins improved. Booher and Hartzler reported their determinations of the vitamin B₁ content of foods in terms of crystalline thiamin. They rate peanuts and pork as the richest sources among the common foods. Munsell has summarized many of the data in the literature on the content of vitamins A, B₁, C, D and riboflavin in many foods. Elvehjem reviewed some of the evidence regarding the nicotinic acid content of foods. Melnick and Field likewise reported many data on the nicotinic acid content of foods as measured by chemical methods. Vuillard, Jean Edouard

(1868-1940). French artist, was born in Cuiseaux. He became

famous for his paintings of French gardens and interiors and in later years he painted the portraits of leading public men, including Camille Chautemps and Yvon Delbos. His paintings were ex-

hibited throughout Europe and there was an occasional exhibition of them in the United States. He is represented in the Metropolitan Museum of Art in New York city and in the museums of Buffalo and Cleveland as well as in several private collections. He died suddenly in La Baule, June 21.

Wages and Hours. During 1940 employment and pay rolls in manufacturing and non-manufacturing industries improved substantially as a result of European War orders and the U.S. defence program. The improvement was particularly noticeable during the latter part of 1940, for which index numbers on employment and pay rolls were not yet available when Table I was compiled. But official "releases" of the United States department of labour reported several hundred thousands re-employed by private industry during the latter half of 1940. On the whole, Table I and Table II show improved employment and higher average weekly earnings during the first half of 1940 as compared with the first half of 1939. Figures for the latter half of 1940, when available, will show substantial improvement in both employment and weekly earnings.

Employment during the first ten months of 1940 was about 7% better than during the corresponding months of 1939 (Table I). This was caused almost entirely by the improvement in employment in the durable goods industries where employment increased 14% to 20% over the corresponding months in 1939. This rise in durable goods employment continued during the latter half of 1940, for two months of which index numbers were not available.

During the period 1937-39 average hourly earnings increased. This was an unusual event. In periods of increased unemployment, such as prevailed from late 1937 through 1938, labour ordinarily experiences reductions rather than increases in average hourly earnings. The contra-cyclical rise in hourly earnings 1937-39 appears to have been the result principally of the upsurge of unionism which began in 1933-34. By 1937 a large number of the new unions had become sufficiently consolidated and effective, and the older unions sufficiently strengthened, so that their increased bargaining power more than counterbalanced the temporarily adverse business trend of late 1937 and 1938 and enabled them, both in union and non-union industries, to push the wage level higher. In the first half of 1940 the higher hourly earnings were maintained but not increased in the majority of industries. Increases of one to three cents per hour were gained in a few industries (Table II). Demands for higher wages were common late in the year.

Wholesale and retail trade, hotels and public utilities experienced but small reductions in hours from 1937 through 1938-39. They are industries which operate standardized hours if they operate at all, and their employees' hours reflect the operating habits of the industries. But the bureau of labour statistics figures show a downward trend of hours in these industries as well as in manufacturing, mining and construction during the period, and it is probable that it was in part due to reduction in hours-standards effected by union agreements. The rise in hourly earnings rates in 1938-39 as compared with 1937 could be illustrated by a few typical cases. The facts shown by these cases are not, of course, universal, but they reflect the dominant trends of the period.

The much higher hourly earnings in some industries are due to one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill, (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers, (3) degree to which union working conditions prevail, (4) necessity of paying high wages to attract labour supply.

Table I.—Employment, Payrolls and Earnings in Manufacturing Industries in the U.S.

(Indexes are based on 3-year average, 1923-25=100, and are adjusted to 1935 census of manufacturers. Not comparable to indexes published by the U.S. Bureau of Labor Statistics prior to August 1938.)

Weekly earnings are really of greater significance than hourly rates, from the point of view of living standards. There were only five industries of the 24 studied in which average weekly earnings exceeded \$30 per week in Aug. 1939, and the maximum was \$33.87 in the crude petroleum and electric light and power industries. The lowest weekly earnings were in hotels, \$15.13. In July 1940, there were eight industries in which average weekly earnings exceeded \$30. Three of these were \$34.63 in electric power; \$33.99 in crude petroleum and \$33.46 in anthracite coal. The lowest, hotels, were but \$15.54.

Seven industries fell between \$20 and \$25 per week and seven between \$25 and \$30; five below \$20 in July 1940.

The wages of farm labour were closely similar in 1940 to 1939, judging by the reports of the U.S. bureau of agricultural economics.

Monthly wages, with board, averaged \$29.01 on July 1, 1940, and \$28.18 in July 1939; daily wages, with board, \$1.37 in July 1940 and \$1.62 in 1939. (D. D. L.)

Great Britain.—In Great Britain, over the year 1939 as a whole, average money wage rates rose by between 4% and 4½%, nearly the whole of the increase occurring during the months after the outbreak of war. The largest increases were in the coal mining, transport and textile trades; the engineering and metal trades had only small advances in wage rates, but average earnings increased substantially, owing to overtime and the earning of larger payments on piecework. During 1940 wages advanced further, the reported changes in rates of wages from January to September involving a weekly increase of £1,757,000 in the wages of 7,725,000 workers, as compared with £236,000 and 395,000 workers in the corresponding period of 1939.

These changes were moderate in comparison with the rise in the cost of living, which stood according to the official index at 89% above the 1914 level in Oct. 1940, as against 55% in Aug. 1939. The trade unions in general refrained from pressing large claims for wage advances, in view of the danger of causing an inflationary movement which would neutralize their effect. The consequence was a considerable widening of the gap between average earnings in establishments engaged on urgent war work and elsewhere, and especially between average earnings in the metal and vehicle trades and in trades which were adversely affected by war conditions. Up to the spring of 1940 there was a tendency for employers in the war trades to bid against one another in order to attract skilled workers. But this policy was checked in the summer by an order forbidding firms to advertise for labour, and also by measures which prevented the offer of abnormally high wage rates. Undoubtedly certain limited classes of highly skilled men have been able to earn very large wages with the aid of heavy overtime.

Table III.—Rise in Hourly Earnings Rates in 1939-40 Compared with 1938 in the U.S.

Industry	Hourly earnings in January		
	1938	1939	1940
Manufactures in general	\$.663	\$.651	\$.663
Durable goods manufactures	.727	.729	.727
Non-durable goods	.602	.585	.607
Iron and steel	.755	.755	.766
Machinery	.732	.724	.735
Lumber and products	.516	.541	.512
Food and products	.618	.628	.641
Tobacco products	.476	.481	.496
Rubber products	.792	.768	.776
Anthracite mining	.917	.928	.919
Bituminous mining	.871	.883	.876
Wholesale trade	.683	.707	.729
Building	.925	.932	.970

In the factory trades there were numerous relaxations of the Factory acts in order to enable women to work beyond the limits which are allowed in normal times. During the first five months of the war, 2,459 factories were granted relaxation, mostly allowing women and young persons over 16 to work up to a maximum of 57 hours a week, as against the limit of 48 hours fixed by the Factory act of 1937.

In July 1940 the ministry of labour, after consultation with the Trades Union congress and the British Employers confederation, issued a pamphlet drawing attention to the need for a reduction in the excessive hours then being worked in many establishments—often as many as 70 or even 80 hours a week. No fixed standard was laid down, but the general conclusion appeared to be that 60 hours should, save in very exceptional cases, be taken as the absolute limit to be aimed at immediately, with a prospect of further reductions to follow, to 55 or 56 hours "which experience in many manufacturing firms shows to be" the highest level compatible with optimum efficiency. The pamphlet also recommended that firms should give attention to various forms of shifts and rota working, in order to relieve strain and make possible easier transport to and from work. The need for adequate breaks, and for the provision of factory canteens and rest rooms was also stressed; and in November it was announced that an order was to be made making canteens compulsory in all the large and middle sized establishments.

The most important special measure affecting wages during 1940 was the establishment in June of the minimum wage of 48s. od. a week for agricultural workers. In other industries wages and conditions were left to be settled by the same methods as in time of peace, subject to the provision of an arbitration system for the adjustment of conditions when the parties were unable to agree. (See LABOUR UNIONS.) (G. D. H. C.)

Wagner-Jauregg, Julius (1857-1940), Austrian physician, was born on March 7 and was educated at the University of Vienna and served there as assistant in pathology in 1881-82. He became assistant in the university clinic in psychiatry the next year and remained there until 1899, when he became professor of psychiatry and neurology in Graz university. In 1893 he returned to the University of Vienna, remaining there until he retired in 1928. He was noted for his investigation into the effect of artificial fever in curing disease. In 1917 he found that tertian malaria was the ideal inoculation agent for treating paresis.

In 1927 he received the Nobel prize in medicine for his epoch-making discovery.

He died in Vienna, Oct. 1.

Wake Island, a possession of the United States of America since 1899, lies in the mid-Pacific in lat. 19° 15' N., long. 166° 38' E. It is about 2,104 mi. W. of Honolulu, Hawaii and 1,334 mi. from Port Apra, Guam. By executive order dated Dec. 29, 1934, Wake island was placed under the control and jurisdiction of the navy department.

The island did not have native or other regular inhabitants until the Pan American Airways established a base there, under licence from the navy department, as a step in its transpacific clipper air route. (L. S. F.)

Wald, Lillian D. (1867-1940), U.S. sociologist, was born in Cincinnati, O., March 10, and died in Westport, Conn., Sept. 1. For a biographical sketch see *Encyclopedia Britannica*, vol. 23, p. 287.

Wales: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

Walker, Frank Comerford (1886—), U.S. postmaster general, was born at Plymouth, Pa. on May 30. After studying at Gonzaga university in Spokane, Wash. and receiving a law degree at the University of Notre Dame, he was admitted to the Montana bar in 1909. In 1913 he was elected to the state legislature. In 1932 he became actively identified with national politics, as treasurer of the Democratic national committee. He was executive secretary of the president's executive council in 1933 and later director of the national emergency council. On Aug. 31, 1940, President Roosevelt nominated him postmaster general to succeed James A. Farley.

He was confirmed by the senate Sept. 6 and sworn into office Sept. 11.

Wallace, Henry Agard (1888—), vice-president of the United States. See *Encyclopædia Britannica*, vol. 23, p. 303. Wallace was secretary of agriculture in the cabinet of Franklin D. Roosevelt from March 4, 1933 until Sept. 5, 1940, when he resigned to campaign for the vice-presidency to which he had been nominated by the Democratic convention in Chicago July 19. President Roosevelt had picked his running mate after his own nomination for a third term, and there was considerable opposition among the convention's delegates to the naming of Wallace. Both Willkie and McNary, the Republican candidates, paid public tribute during the campaign to Wallace's accomplishments as secretary of agriculture. In his speech of acceptance at Des Moines Aug. 29, Wallace denounced the Republican party as the party of appeasement. After the election Nov. 5 Roosevelt named Wallace as the official representative of the United States at the inauguration of President Manuel Avila Camacho of Mexico at Mexico City Dec. 1.

Wang Ching-wei (1885—), Chinese statesman, head of the Japanese-dominated "National Government of China" at Nanking. He was born at Canton, probably in 1885, although some sources give 1884 or 1883 as his birth date. He studied law in Hosei university, Japan, and while in Tokyo became interested in the revolutionary program of Sun Yat-sen, with whom he later became acquainted.

In 1911, after a term in prison for attempting to assassinate the prince regent, Wang became editor of *Ming Pao*, an organ which advocated establishment of a republic. By 1924 he was Sun Yat-sen's chief adviser and in 1925, after Sun's death, he became chairman of the political council of the Kuomintang. Two years later he resigned after splitting with Chiang Kai-shek, Sun's other prominent disciple, in a quarrel that curiously paralleled the feud between Stalin and Trotsky. Wang was expelled from the Kuomintang in 1929 for plotting against the Nanking government but was reinstated in 1931 and became president of the executive Yuan (1932-35). He was also minister of foreign affairs from 1933 to 1935.

In 1939 he was again ousted by Chiang from the Kuomintang and deprived of all political offices for making peace overtures to Japan.

On March 30, 1940, under the protection of the Japanese army of occupation, Wang set up his puppet government in Nanking and called upon all followers of Chiang to lay down their arms. The "National Government of China" was officially recognized by Japan in a treaty signed Nov. 30. Chiang's answer to this treaty was the offer of a reward of 100,000 Chinese dollars for the capture of Wang.

The U.S. reply was a loan of \$100,000,000 to the government of Chiang at Chungking.

¹The German government has been notified that the government of the United States will look to the German government for the discharge of this indebtedness of the government of Austria to the government of the United States.

²Indebtedness to the United States under agreements of June 23, 1930 and May 26, 1932.

nations in the principal amount of \$10,338,312,074.70. Additional obligations amounting to \$12,167,000 were acquired from Greece in 1929. Funding agreements with 13 countries were reached during the years between 1923 and 1926; an agreement with Greece was made in 1929, and an agreement with Austria in 1930, setting their debt with interest to the respective funding dates at \$11,577,260,885 generally payable with interest charges over a period of 62 years. Of the others Cuba and Liberia paid their debt in full. The unpaid balance of the indebtedness of Nicaragua which consisted of obligations in the principal amount of \$289,898.78, together with interest thereon, was cancelled in connection with the settlement of a claim of Nicaragua for refund of certain income taxes paid by the Ferrocarril del Pacifico de Nicaragua (a railroad owned and operated by Nicaragua), under article II of the agreement of April 14, 1938. No agreements were ever reached with Armenia and Russia. (D. W. B.)

War Propaganda: see PROPAGANDA.

Washington, a state in the extreme northwest United States, popularly known as the "Evergreen state." Area, 66,836 sq.mi.; tidal shore line, 1,721 mi.; population (U.S. census 1930) 1,563,396; (U.S. census 1940) 1,736,191; represented an increase of 11-1% during decade 1930-40 as against 15-2% for the previous decade. Capital, Olympia, 13,254; three largest cities: Seattle, 368,302; Spokane, 122,001; Tacoma, 109,408. The urban population was 921,969 or 53-1%. In 1930 native-born whites dominated population percentages with 81-7%; of the 244,256 foreign-born whites, Canada, Sweden, Norway, Germany and Great Britain furnished one-half. Negroes numbered 6,840; Japanese, 17,837; Chinese, 2,195; Filipinos, 3,480; Indians (Jan.

1939), 13,913.

History.—A record in number of citizens registered and in votes cast by the electorate marked the 1940 elections. In the Democratic primaries, a spirited contest between Governor Clarence D. Martin, presenting himself for a third term, and ex-Senator Clarence C. Dill, resulted in the nomination of the latter. He was, however, defeated in the final election by Republican Arthur B. Langlie, mayor of Seattle, by a vote so close that the outcome was not determined until the count of the unusually numerous absentee ballots was made. Notice was given that the gubernatorial election would be contested because of the counting of ballots (party column) showing irregular cross marking. There were 5 incumbents among the 7 Democratic state officers elected on party tickets. For the non-partisan post of superintendent of public instruction, Pearl A. Wanamaker defeated Stanley F. Atwood, incumbent. For United States senator, Mon C. Wallgren, former congressman from the 2nd district, won from Republican Stephen F. Chadwick of Seattle, former national commander of the American Legion. Six Democrats, 5 re-elected, were sent to congress. President Roosevelt's popular vote for the state's 14 electoral votes exceeded that of any candidate on the state ballot, 462,145 to 322,123 for Wendell L. Willkie.

The legislature in its 27th session consisted of 38 Democrats and 8 Republicans in the senate and 70 Democrats as against 29 Republicans in the assembly.

The chief state officers: Arthur B. Langlie, governor; Victor A. Meyers, lieutenant governor; Mrs. Belle Reeves, secretary of state; Cliff Yelle, state auditor; Otto A. Case, state treasurer; Smith Troy, attorney-general; Progressive, Jack Taylor, commissioner of public lands; William A. Sullivan, insurance commissioner; Pearl A. Wanamaker, superintendent of public instruction.

The collapse of the Tacoma Narrows bridge completed during 1940 was a catastrophe in which there were no casualties and in which the loss was covered by insurance.

Education.—The system of higher education included a university, a state college and three colleges of education. During the school year 1939-40, average daily attendance in elementary and secondary schools was 274,565, the number of teachers exclusive of principals and superintendents, employed therein, 10,583. Total instructional cost was \$29,442,858.32 and such cost per pupil in daily attendance \$107.23. Salaries of teachers, exclusive of superintendents, averaged \$1,641.17.

Banking and Finance.—Revenues and expenditures for the biennium ending Sept. 30, 1940 represented an increase over previous years. Gross revenues amounted to \$188,555,335.88; the cash balance as of Sept. 30, 1938 was \$11,764,159.91. The gas tax contributed \$35,410,151.70, and the sales tax \$55,482,928.39. As total disbursements amounted to \$183,626,693.11, the cash balance on Sept. 30, 1940 was \$16,692,802.68. The bonded debt

ARTHUR LANGLIE, Republican, won Washington's election for governor Nov. 5, 1940, after a close race

was \$7,496,000. One hundred and forty-two banks in the state reported total capital of \$25,861,000; capital, surpluses and undivided profits of \$46,588,000; deposits of \$598,518,000; resources of \$657,874,000.

Agriculture, Manufactures and Mineral Production.—Statistics for the decade 1930-40 revealed the trend toward a reduction of income from farm crops of about one-third over the previous decade (\$122,949,000 in 1929 to \$80,208,000 in 1939).

Production of Farm Crops of the State of Washington

Leading crops	Value 1939	Av. Prod. 1939-38	Prod. 1939	Prod. 1940 (est.)
Wheat	\$28,484,300	44,421,000 bu.	43,822,000 bu.	42,982,000 bu.
Apples (commercial crop)	18,200,000	29,411,000 bu.	26,000,000 bu.	28,804,000 bu.
Hay (wild and tame)	16,810,100	1,671,000 tons	1,025,000 tons	1,960,000 tons
Potatoes	4,410,000	8,368,000 bu.	7,350,000 bu.	7,560,000 bu.
Oats	3,927,350	7,791,000 bu.	11,221,000 bu.	9,360,000 bu.
Pears	3,120,660	4,781,000 bu.	5,779,000 bu.	6,585,000 bu.

In lumber, the second largest wealth producer for Washington which outranks all states, there was a definite improvement since 1937. Salmon and halibut constituted the basis of sea food production in which the state is also first. Most conspicuous, however, was the upward surge in mining. Copper production which in 1937 amounted to but 128,000 lb., jumped to 12,034,000 lb. in 1938 and 17,996,000 lb. in 1939. During 1937, 3,057 manufacturing concerns produced goods valued at \$675,640,000.

(H. J. DE.)

Washington, District of Columbia, U.S., during the decade which ended with the 1940 census, increased in population 36.2%, a rate more than three times that of the previous decade. The federal city thus advanced from 15th to 11th place among the cities of the country. Pop. (1930) 486,869; (1940) 663,091, federal census. In the Washington region, covering a territory within about a 20-mi. radius of the White House, the increase was 43%, making a total population of nearly 1,000,000.

The National Capital Park and Planning commission in 1940 completed ten years of park-purchase operations under the Capper-Cramton act of May 29, 1930. In the regional park plan, the section of the George Washington Memorial parkway, extending from Mount Vernon and Ft. Washington 30 mi. along the Potomac river to Great Falls, was being built from the Maryland line to Great Falls. A new section of the parkway was being developed in Alexandria.

During 1940 the National Park service completed development of the Rosslyn plaza and the additional span over the Key bridge as a part of the Memorial parkway and the C. & O. canal, purchased by the National Capital Park and Planning commission, was opened for recreational use between Washington and Seneca, a distance of 22 mi. The war department transferred to the National Park service the entire 341 ac. of Ft. Washington, as authorized in the Capper-Cramton act. In co-operation with the Maryland National Capital Park and Planning commission and the United States engineer office, plans were developed for a joint flood control and park project in Anacostia River park beyond the district line. This will form a link of the Baltimore-Washington parkway extending along the northeast branch of the river.

Within the District of Columbia the National Capital Park and Planning commission acquired about 90% of the land for the Fort drive, a 23-mi. parkway encircling the city. During the fiscal year of 1940 somewhat over \$1,000,000 was expended for land acquisitions for parks, parkways and playgrounds for Washington. In the development of the city and regional plan of Washington, special attention was paid to plans for public buildings in the central area, the development of modern zoning regulations, and the formulation of a preliminary metropolitan area

plan. Following the recommendation of the Planning commission, the president submitted to congress for the first time a proposal for an office building east of the capitol. Other public building proposals included acquisition of land for a state department annex north of the present building, a site for the coast guard on the Washington channel water-front, and sites for a west central heating plant and the general accounting office. Appropriations were made for the last two. Approval was also given to the plan for a memorial garden to Oliver Wendell Holmes in the rear of the Supreme Court building as a part of the general East Capitol street plan.

With the advice of Harland Bartholomew and Alfred Bettman, planning consultants, the Planning commission was modernizing the zoning regulations. In 1940 the Alley Dwelling authority leased Langston from the United States Housing authority and was operating the housing project on a system of graded rents. The current construction program included about 3,000 dwellings in 10 projects. The housing projects erected under the Alley Dwelling Authority act were being operated on a sound economic basis, with no subsidies. (H. Js.)

Washington National Airport: see AIRPORTS AND FLYING FIELDS.

Water Power. Increase of installed capacity of water wheels reported in 1940: 3,400,000 h.p. Total reported capacity Jan. 1, 1941, about 69,400,000 h.p., on the basis of the report of the United States Geological survey. Of the increase in installed capacity, about 36% was in plants that were not reported in detail (principally in Japan), some of which were probably built prior to 1940, and 64% in plants listed below. Even the figures here given for both the installations in 1940 and the total installations, are incomplete, since China, France, Germany, Great Britain, Italy and Japan stated that it was inadvisable to submit reports because of war conditions.

The following water power plants and capacities in different countries were reported as completed in 1940 or under construction at the end of the year, with a few plants completed previously but reported too late for the previous year's record.

Alaska: Three small plants, totalling 221 h.p., to be completed in 1941.
Algeria: On Fodda river near Uued Fodda, 13,400 h.p., under construction, date of completion not stated.

Argentina: On Andalgala river at Andalgala, Catamarca, addition of 134 h.p., making capacity 218 h.p.; on Curi Leuvu river at Chos Malal, Neuquen, 67 h.p. Under construction: On Tercero river at Almafuerde, Córdoba, 14,500 h.p.; and on Saucos river at Pozos, Córdoba, 5,400 h.p., to be completed 1943.

Bolivia: On Zongo river near La Paz, addition of 2,500 h.p., making capacity 6,750 h.p.

Brazil: On Cupioba-Assu river at Sao Felipe, Bahia, 41 h.p.; on Ribeirao Cambe river at Londrina, Parana, 370 h.p.; on Indios river at Chapeco, Santa Catharina, 50 h.p.; on Pardo river at Candelaria, Rio Grande do Sul, 162 h.p.; at junction of Anicuns and Pianco rivers at Anapolis, Goyas, 540 h.p.; on Piracicaba river at Rio Piracicaba, Minas Geraes, 13,400 h.p.; on Orfaos river at Joao Pinheiro, Minas Geraes, 29 h.p.; on Peixe river at Martinopolis, São Paulo, 2,280 h.p.; on Ribeirao das Lages river at Pirai, Rio de Janeiro, addition of 47,000 h.p., making capacity 127,000 h.p. On Una river at Agua Preta, 510 h.p.; on tributary of Camaragibe river at Ribeirao, 150 h.p.; on Ipojuca river at Bonita, 600 h.p.; on Serinhaem river at Gamelleira, 200 h.p. Plants under construction, dates of completion unknown: On Serinhaem river at Serinhaem, 650 h.p.; on Una river at Palmares, 330 h.p.; on Mundu and Corrente rivers at Corrente, 330 h.p.; on São Francisco river at Itaparica, 2,000 h.p. The following 7 plants were completed before 1940 but were not reported: On Carneirinhos river 2 plants at Rio Piracicaba, Minas Geraes, 844 h.p. and 568 h.p.; on Ribeirao Santo Antonio river at Minas Novas, Minas Geraes, 24 h.p.; on Novo river at Aguas Belas, Minas Geraes, 84 h.p.; on Meia Ponte river at Inhumas, Goyaz, 98 h.p.; on Peixe river at Piedade, São Paulo, 2,570 h.p.; on Pirapora river at Piedade, São Paulo, 245 h.p.

Canada: New water power installations during 1940 totalled 302,690 h.p., the largest increase in any of the last five years, bringing the total capacity of water power plants to 8,584,438 h.p. About two-thirds of the increase was in new plants and the balance in additions to existing plants. New plants were completed as follows: On St. Maurice river at La Tuque, Que., 178,000 h.p.; on Black river at Hollow Bridge brook, N.S., 7,500 h.p. Additions were completed as follows: On Kootenay river near Nelson, B.C., 50,000 h.p.; on Millstone river on Vancouver island, 7,500 h.p.; on English river at Ear Falls development, Ont., 7,500 h.p.; on South river near South River, Ont., 380 h.p.; on Whitefish river at Whitefish Falls, Ont., 160 h.p.;

on St. Lawrence river at Beauharnois, Que., 53,000 h.p.; on Saguenay river at Chute à Caron, 5,000 h.p. The following plants were under construction, to be completed as indicated: On Kootenay river below Nelson, B.C., 90,000 h.p., date of completion not stated; on Yellowknife river north of Yellowknife, Yukon, 4,700 h.p., 1941; on Montreal river at Upper Falls, Ont., extension 10,000 h.p., 1941; on Musquash river at Big Eddy, Ont., 10,000 h.p., 1941; on Madawaska river near Calabogie, Ont., 56,000 h.p., 1942; on St. Lawrence river at Beauharnois, Que., extension 53,000 h.p., 1941 and preparation for two additional units of same size is under way; on upper Ottawa river, Que., 48,000 h.p., 1941; on outlet of Cameron lake, Temiskaming Co., Que., 250 h.p., 1941; on Black river at Pembroke, Que., extension 2,200 h.p., 1941.

Chosen: On Yalu river at Suiho, North Heian province, 400,000 h.p. installed, ultimate capacity 933,000 h.p., to be completed in 1942; on Yujo river at Funei, North Kankyo province, 40,000 h.p.; on Kyosen river at Kyosenko, North Kankyo province, 293,000 h.p.; on Yalu river at Gishu and Ingen, 453,000 h.p., to be completed in 1942, to be divided equally between Chosen and Manchoukuo; on Kinko river in South Chusei province, 101,000 h.p., date of completion not stated; on Kan river at Seizen, Kogen province, 400,000 h.p., to be completed in 1942.

Colombia: Surveys completed for plant on Nima river at Palmia, Valle del Cauca, initial capacity 3,350 h.p., ultimate 7,400 h.p., to be completed 1941-42; on Nare river near Puerto Berrio, Antioquia, 5,000 h.p., to be completed 1941.

Costa Rica: On "Quebrada Avance" at La Union, Tres Ríos, 348 h.p.; on Tapesco river at Tapesco de Alfaro Ruis, Alajuela, 16 h.p.

Cuba: On San Juan de Letran river at Trinidad, Las Villas, 208 h.p., date of completion not stated.

Ecuador: On Pilalo river at Macuchi, Cotopaxi, 1,200 h.p.; on Granobles river at Tabacundo, Pichincha, 62 h.p., to be completed 1941.

Egypt: On Wadi drain in Fayoum, 4,634 h.p.; on conversion canal from Nile river near Fuad I Barrage, Qena, 4,080 h.p., completed in 1940.

Ire: On Liffey river at Poulaphuca near Dublin, 45,000 h.p., to be completed 1941.

Finland: Seven plants under construction to be completed on dates indicated: On Kajaani river at Kajaani, extension 2,000 h.p., making capacity 5,000 h.p., 1941; on Kajaani river at Kajaani, 8,000 h.p., 1943; on Paatsjoki river at Inari, 39,500 h.p., 1941; on Pajianten river at Vaajakoski, 2,900 h.p., 1941; on Oulunjoki river at Oulu, 41,500 h.p., 1943; on Kyminjoki river at Kuusankoski, 40,000 h.p., 1943; on Kokemaenjoki river at Kokemaki, 47,000 h.p., 1943.

Honduras: On tributaries of Choluteca river at La Leona, Tegucigalpa, 500 h.p.

Hungary: Plants under construction, date of completion not stated: On Ung river at Felsodomonya, 3,640 h.p., and at Ungvar, 2,600 h.p., on Hernad river at Kesznyeten, 3,000 h.p.

Iceland: On Budara river at Reydarfjordur, extension of 87 h.p., making capacity 260 h.p.

India: On Swat river at Jabban, Malakand, 12,850 h.p.; on Sharavathi river at Jog or Gersoppa Falls, ultimate 100,000 h.p., construction started but discontinued, on account of world conditions; on Pykara and Mukurti rivers in Nilgiris district, Madras, addition of 67,000 h.p., making capacity 92,100 h.p.; on Shimsha river at Shimshapura, 23,000 h.p., under construction, completion delayed by war; on Muderapuzha, Periyar river at Pallivasal Munnar, 18,000 h.p., ultimate 36,000 h.p., completion not stated; on Tambraparni river in Tinnevely district, Madras, 23,300 h.p., to be completed 1941.

Italy: Plans formulated by a state commission in 1937 to increase capacity of water power plants by about 30%. Forty new plants with capacity of 230,000 h.p. have been completed and 89 plants with capacity of 816,000 h.p. are under construction to be completed 1942. (Abstracted from address by minister of public works, delivered April 24, 1940.)

Jamaica: On Volute river at Retreat, 120 h.p.

Lithuania: On Sesupe river at Naumiestis, Sakiai, 268 h.p.; on Neris river at Turniskas, Vilnius, 20,000 h.p., to be completed 1942.

Mexico: On Xia river near Calpulalpau, Oaxaca, 500 h.p.; on San Pedro river 45 mi. north of Boquilla dam, Chihuahua, 1,800 h.p.; on Grande de Morelia river near Lago de Patzcuaro, Michoacan, 5,600 h.p.; on Caracha river 40 mi. south of Lago de Patzcuaro, Michoacan, 700 h.p.; on Azul river east of Chilpancingo, Guerrero, 7,500 h.p. To be completed in 1941 or later: On Cupatitzio river near Cuapau, 8,000 h.p. and near Uruapan, Michoacan, 6,200 h.p.; on Ingenio river northeast of Tepic, 430 h.p., ultimate 4,300 h.p. and north of Tepic, Nayarit, 3,200 h.p.; on Nazas river east of junction of Ramos river, Durango, 90,000 h.p.; on Jaripo river near Juiguilpan, Michoacan, 1,575 h.p.; on unknown river, 20 mi. west of Juiguilpan, Michoacan, 83 h.p.; on Chupio river near Chupio, Michoacan, 940 h.p.; on Apatlaco river near Ceurnavaca, Morales, 418 h.p.; on Tilostoc river west of Valle de Bravo, 41,400 h.p., ultimate 125,000 h.p.; on Azul river southeast of Chilpancingo, Guerrero, 10,700 h.p.; on Santiago river at Guadalajara, Jalisco, addition making capacity 6,000 h.p.

Morocco: On Cum-er-Rebia river near Kasbah Tadla, 9,400 h.p.; on N'Fis river at Lalla Takerkoust, Western Marrakesh, capacity not reported, completion delayed by war conditions.

Newfoundland: On Tors Cove river at Tors Cove, 8,400 h.p., to be completed 1941. Capacity of all plants 236,000 h.p.

New Zealand: On Waitaki river at Kurow, addition of 40,000 h.p., making capacity 80,000 h.p.; on Waikato river at Arapuni, addition of 56,000 h.p., making capacity 195,000 h.p., to be completed 1941; on Waikaretaheke river at Tuai, 53,000 h.p., to be completed 1941; on Waikato river at Karapiro, 120,000 h.p., to be completed 1943; on Waitaki river at Lake Tekapo, 28,800 h.p., to be completed 1943; on Rangitata river at High Bank, 31,600 h.p., to be completed 1941; on Waipori river at Waipori, addition of 8,000 h.p., making capacity 31,200 h.p., to be completed 1941; on Cobb river near Mt. Cobb, 16,000 h.p., to be completed 1942.

Nicaragua: On Yy river, 17 mi. northwest of Siuna, 1,800 h.p., to be completed 1941; on Carca river at San Gregorio mine, 140 h.p.

Peru: On Chili river at Charcani, Arequipa, 2,640 h.p.; on Chicama river

at Usquil, Trujillo, 36 h.p.; on Huallaga river at Huánuco, 446 h.p.; on unknown river at Hualgayoc, 39 h.p.; on unknown river at Cabana, Ancash, 27 h.p.; on unknown river at Anta, Cuzco, 12 h.p. and on unknown river at Paucarbamba, 20 h.p., to be completed 1941; on Torrioc river at Janchis-cocha, Jauja, 168 h.p.

Philippine Islands: On Priusa river near sources, Laguna, San Pablo, 120 h.p. extension; on Caliraya river at Lumban, Laguna, 37,500 h.p., to be completed 1942, ultimate capacity 50,000 h.p.; on Laloy river and Malinao creek and tributaries at Lubuagan, Kalinga, capacities not given, combined heads about 12,500 ft., date of completion not stated.

Spain: On Ebro at Flix, Tarragona, 60,000 h.p., to be completed 1945; on Ter river at Pastoral, Gerona, 2,000 h.p. to be completed 1942. Repairs to war-damaged plants under way.

Sumatra: On Asahan river at Wilhelmina Falls, Tapanoeli, 67,500 h.p., to be completed 1944, depending on political situation.

Switzerland: On Aare river at Innertkirchen, Berne, 165,000 h.p., to be completed 1942; on Rhine river at Rekingen, Aargau, 48,000 h.p., to be completed 1941; on Rhone at Geneva, 94,500 h.p., to be completed 1942.

Thailand (Siam): On Meklong river at Saiyoke, Changvad, project under way, estimated cost \$3,500,000. Date of completion indefinite.

Union of South Africa: Additions were made to plants at Mbabane, Swaziland, at Lydenburg and Nelspruit, Transvaal, and at Villiersdorp, Cape Province, total about 500 h.p., names of rivers not given.

Union of Soviet Socialist Republics: On Chirchik river at Chirchik, Uzbek (Asia), 57,500 h.p.; on Volga river at Uglich, Moscow Oblast, 147,500 h.p. The following projects are under construction, date of completion as indicated: On Volga river in Kuibyshev Oblast, 4,560,000 h.p., 1945-46; on Volga river at Rybinsk, Yaroslavl Oblast, 440,000 h.p., 1943; on Irtysh river at Ust-Kamenogorsk, Kazakstan (Asia), 320,000 h.p., 1944-45.

United States: Water power plants and additions to existing plants were completed as follows: Two plants in California on All-American canal from Colorado river, 20,800 h.p.; on Eel river at Potter valley, Calif., extension of 6,500 h.p., making capacity 14,500 h.p.; on Flint river near Warwick, Ga., extension 6,800 h.p., making total capacity 14,000 h.p.; on Snake river near Idaho Falls, Ida., 2,500 h.p., ultimate capacity 5,000 h.p.; on North Santiam river at Idanha, Ida., 340 h.p.; on Ossipee river at Kezar Falls, Me., plant rebuilt increasing capacity from 200 h.p. to 500 h.p.; on Kennebec river at Bingham, Me., addition 34,000 h.p., making total capacity 102,000 h.p.; on Penobscot river at Mattawamkeag, Me., addition 6,250 h.p., making total 18,050 h.p., another unit to be added in 1941; on North Platte river near Brady, Neb., 24,000 h.p.; on Rio Grande at Elephant Butte dam, N.M., 34,500 h.p.; on Hiawasee river near Murphy, N.C., 80,000 h.p., ultimate 160,000 h.p.; on Saluda river near Chappells, S.C., 22,000 h.p.; on Rocky river near Lowndesville, S.C., 3,500 h.p.; on Tennessee river at Chickamauga, Tenn., 108,000 h.p., ultimate 144,000 h.p.; on Colorado river at Austin, Tex., 20,000 h.p., ultimate 27,000 h.p.; on Fox river at Kaukauna, Wis., 3,200 h.p., ultimate 8,000 h.p.; on Columbia river at Bonneville, Wash.-Ore., extension 148,000 h.p., making total 416,000 h.p., ultimate 712,000 h.p., scheduled for completion in 1944; on Vacas river near Guyama, Puerto Rico, two plants, 17,000 h.p. The following plants and additions to existing plants were under construction: On Tennessee river at Guntersville, Ala., extension 34,000 h.p., making total 136,000 h.p., the ultimate capacity; at Wilson dam, Florence, Ala., 140,000 h.p. to be added by 1942, making total 440,000 h.p., ultimate 700,000 h.p.; at Wheeler dam, Ala., 90,000 h.p., to be added by 1941, making capacity 180,000 h.p., ultimate 360,000 h.p.; on Colorado river near Parker, Ariz., initial capacity 120,000 h.p., to be completed in 1942, ultimate capacity 160,000 h.p.; on Colorado river at Boulder, Ariz.-Nev., extensions totalling 875,000 h.p. in progress, ultimate capacity 1,835,000 h.p., to be completed 1945; on Sacramento river near Kennett, Calif., initial capacity 412,000 h.p., to be completed in 1943, ultimate capacity 515,000 h.p.; on Blue river near Kremmling, Colo., 30,000 h.p., to be completed 1942, part of Colorado-Big Thompson project involving 6 power plants with an ultimate capacity of 190,000 h.p.; on Snake river at Minidoka, Ida., extension of 7,000 h.p., making total 20,500 h.p., to be completed in 1942; on Tennessee river at Gilbertsville, Ky., initial capacity 176,000 h.p., to be installed in 1945, ultimate 220,000 h.p.; on Missouri river at Fort Peck, Mont., initial capacity 70,000 h.p., ultimate 150,000 h.p., date of completion uncertain; on North Platte river near Lexington, Neb., two plants, initial capacity 48,000 h.p., ultimate 72,000 h.p., to be completed in 1941; on Nantahala river at Nantahala, N.C., 60,000 h.p., to be completed in 1941; on West Fork of Tuckasee river near Glenville, N.C., 30,000 h.p., to be completed in 1941; on Yadkin river at High Point, N.C., 8,000 h.p., to be completed in 1941; on Neosho (Grand) river near Pensacola, Okla., initial capacity 80,000 h.p., to be installed in 1941, ultimate capacity 120,000 h.p.; on Rocky river near Lowndesville, S.C., 4,115 h.p., to be completed in 1941; diversion from Santee river near Moncks Corner, S.C., initial capacity 173,300 h.p., ultimate 213,300 h.p.; on Tennessee river at Pickwick Landing, Tenn., 96,000 h.p., to be added by 1942, making capacity 192,000 h.p., ultimate 288,000 h.p.; at Ft. Loudon, Tenn., 88,000 h.p., to be installed in 1944, ultimate 132,000 h.p.; at Watts Bar, Tenn., 126,000 h.p., to be installed in 1942, ultimate 210,000 h.p.; on Holston river at Cherokee dam, Tenn., initial capacity 124,500 h.p., to be installed in 1942, ultimate 166,000 h.p.; on Red river at Denison, Tex., initial capacity 97,000 h.p., ultimate 242,500 h.p., date of completion uncertain; on Brazos river near Palo Pinto, Tex., initial capacity 34,000 h.p., to be installed in 1941, ultimate 51,000 h.p.; on Colorado river 15 mi. northwest of Austin, Tex., initial capacity 67,000 h.p., to be installed in 1941, ultimate capacity 100,000 h.p.; on Columbia river at Grand Coulee, Wash., initial capacity 450,000 h.p., to be installed in 1941-42, and 1,350,000 h.p. by 1947, ultimate 2,700,000 h.p.; on Skagit river at Ruby dam, Wash., ultimate 480,000 h.p.; on Flambeau river at Ladysmith, Wis., addition of 1,000 h.p., to be completed in 1941, making capacity 3,000 h.p. The total capacity of water-power plants of 100 h.p. or more in the United States at the end of 1940 was about 19,000,000 h.p.

Uruguay: On Negro river at Rincon del Bonete, 161,000 h.p., under construction, completion dependent on getting equipment from Germany.

Yugoslavia: On Temska river near Piro, 670 h.p.; on Letnica river at

Ramno, 168 h.p.; on Trebisnica river at Pares, 600 h.p.

The following countries reported no water power plant construction in 1940: Azores, Bahamas, Bermuda, British Guiana, British Honduras, British West Indies, Canary Islands, Chile, Costa Rica, Denmark, Dominican Republic, El Salvador, Gibraltar, Guatemala, Haiti, Martinique, Morocco, the Netherlands, Newfoundland, Panama, Paraguay, Portugal, Venezuela.

WORLD WATER-POWER RESOURCES AND THEIR UTILIZATION

The capacity of a water-power site—the water-power resource at a site—is directly proportional to both the quantity of water and the amount of fall, or the head. Hence, large rivers or considerable fall or both, in regions of sufficient precipitation to produce sustained stream flow, are needed for the generation of great quantities of water power.

Water-power resources are utilized only where there is need for the energy that may be generated. Such need must generally relate to industry, transportation, lighting and heating. The extent of the use of water power will depend upon costs of developing individual sites, distances of transmission to power markets, climate, plane of living of the people of the region, local availability of fuels and other natural resources, transportation facilities, availability and cost of capital, quality and cost of labour, governmental attitude toward industrial development and other factors. The utilization of electric energy is promoted by the interconnection of water-power plants and fuel-power plants to form great power systems of generation and distribution by which the supply of energy and the market for it are stabilized and assured.

Table I.—Countries or Regions Which Have 25,000 Horsepower or More in Water Wheels

Country or Region	Capacities of installed water wheels (horsepower)	Potential water-power resources based on ordinary minimum flow (horsepower)	Country or Region	Capacities of installed water wheels (horsepower)	Potential water-power resources based on ordinary minimum flow (horsepower)
Africa			Europe—Cont.		
Belgian Congo and Belgian mandate . . .	70,000	130,000,000	Rumania . . .	127,000	3,000,000
Morocco and Algeria . . .	71,400	650,000	Spain . . .	1,400,000	5,700,000
All others . . .	67,900	143,350,000	Sweden . . .	2,425,000	4,000,000
Sum . . .	209,300	274,000,000	Switzerland . . .	3,000,000	3,600,000
			U.S.S.R. . .	1,850,000	14,000,000
Asia			Yugoslavia . . .	250,000	4,000,000
Asia Minor . . .	48,300	700,000	All others . . .	70,000	1,600,000
Chosen (Korea) . . .	1,145,000	3,000,000	Sum . . .	30,002,000	74,000,000
India and Ceylon . . .	600,000	39,000,000			
Japan . . .	6,000,000	7,000,000	North America		
Siam and Malay States . . .	50,000	5,700,000	Alaska . . .	45,027	1,400,000
Taiwan (Formosa) . . .	237,000	1,000,000	Canada . . .	8,584,438	25,500,000
U. S. S. R. . .	134,500	64,000,000	Costa Rica . . .	31,000	1,400,000
All others . . .	6,800	30,600,000	Guatemala . . .	35,000	2,100,000

			Peru . . .	175,000	6,400,000
			All others . . .	58,000	17,200,000
			Sum . . .	1,650,000	74,000,000

Table II.—Summary of Water-Power Resources by Continents

Continent	Horsepower	Percentage of total resources
Africa	274,000,000	40.9
Asia	151,000,000	22.5
Europe	74,000,000	11.0
North America	77,000,000	11.5
Oceania	21,000,000	3.1
South America	74,000,000	11.0
Totals	671,000,000	100.0

Table III.—Capacity of Installed Water Wheels by Continents

Continent	Horsepower	Percentage of total water-wheel capacities
Africa	210,000	0.3
Asia	8,220,000	11.9
Europe	20,930,000	43.0
North America	28,540,000	41.1
Oceania	900,000	1.3
South America	1,650,000	2.4
Totals	69,450,000	100.0

Rivers are used also for other purposes—navigation, irrigation and municipal and industrial water supplies—and some uses conflict with others. Conflicts in use are best resolved by such co-ordination of all uses as will serve most effectively the interests of the people and, therefore, of the nations. The uses should be co-ordinated also with the construction and operation of storage reservoirs and with other devices for controlling quantities and times of stream flow. Only by optimum combinations of resources, development and utilization, have reasonably complete and satisfactory uses of water-power resources been obtained.

Direct comparison cannot be made between the resources and installed capacities shown in the tables as they are not and cannot be presented on the same basis; the former can be presented only on a uniform basis of fall and some selected stage of flow, the latter must be presented on the variable basis of installed capacities which in some instances of stand-by plants built in connection with large reservoirs may be many times those needed for minimum flows and which average two or three times the capacities needed for ordinary minima.

The wide variations in potential water power and in the factors which are favourable to its development lead to great differences in the utilization of the water-power resources of different countries.

This is shown by the statistics on page 715 of resources and installed water wheels, compiled from mimeographed reports of the United States Geological Survey. (See also DAMS; ELECTRIC TRANSMISSION AND DISTRIBUTION; TENNESSEE VALLEY AUTHORITY.) (N. C. G.)

Water Supply and Sewage: see PUBLIC HEALTH ENGINEERING.

Watrous, Harry Willson (1857-1940), U.S. artist, was born in San Francisco, Calif., Sept. 17. He studied art in the Atelier Bonnat and Académie Julian in Paris and devoted himself to genre painting, specializing in small figures with much detail. He won the Clark prize of the National Academy of Design in 1894 and received a gold medal at the St. Louis exposition. In 1929 the Altman prize of \$1,000 was awarded to him by the National academy. He won many other prizes and medals, and was president of the National Academy of Design in 1933. Watrous died in New York city, May 10.

Watts Bar Dam: see TENNESSEE VALLEY AUTHORITY.

Waugh, Frederick Judd (1861-1940), U.S. artist, was born in Bordentown, N.J., Sept. 13, the son of a portrait painter. He received his art education in the Philadelphia Academy of the Fine Arts and the Académie Julian in Paris and exhibited in the Paris salon and in the Royal academy in London. He devoted himself to painting the sea in its various phases and his marines are in museums in many cities of the United States, England and South Africa. He received the National Academy of Design's Palmer Memorial Marine prize of \$1,000 for a painting in 1929, and for five years his paintings in the annual exhibition of the Carnegie institute in Pittsburgh won the popular prizes. He died in Provincetown, Mass., Sept. 10.

Wavell, Sir Archibald Percival (1883-), British soldier, born in May, was the son of Maj. Gen. A. G. Wavell. Following his father's career, he enlisted in the Black Watch in 1901 after studying at the royal military college and the staff college and saw action in the Boer war, in India and the World War of 1914-18. He then served with the Egyptian expeditionary force until 1920. In 1938 he was promoted to lieutenant general. From 1937 to 1938 he commanded the British troops in Palestine and Trans-Jordan, and in 1940 he became commander in chief of the British armed forces in the middle east. In this office his biggest problem was the Italian invasion of Egypt which began Sept. 12 and advanced as far eastward as Sidi Barrani.

Wealth and Income, Distribution of.

There are three major types of income payments received by individuals: payments in return for services of labour, payments in return for the use of capital, and payments made gratuitously or

without reference to services currently rendered. Table I presents some of these figures for the United States in selected years.

The major part of total income payments to individuals took the form of salaries and wages paid to labour. Dividends, interest and net rents and royalties were capital return items and accounted in total for about one-

Table I.—U. S. Income Payments to Individuals, by Type of Payment*
(000,000,000's of Dollars)

Type of Payment	1929	1933	1937	1939	1940†
Total payments to individuals . . .	\$82.06	\$46.83	\$71.78	\$70.10	\$74.07
Salaries and wages† . . .	52.29	29.12	45.29	44.41	40.95

sixth of aggregate payments in 1939 and 1940. Withdrawals by self-employed persons out of business earnings or capital also accounted for about one-sixth of total payments and represented return on invested capital as well as on the personal services of these entrepreneurs. Other amounts were small, relative to aggregate payments of all types, but provided the principal source of income for many persons who were unemployed and possessed no substantial amounts of personal capital.

The relative variability of the different types of income sometimes has been studied in order to determine if the income received by labour is curtailed or advanced to a greater or lesser extent than income received by owners of capital when total income declines or expands.

While dividends fluctuated considerably more than total income payments, interest was much more steady, and the sum of dividends, interest and net rents and royalties, indicative of return on invested capital, was equivalent to 18.5% of total income payments to individuals in 1929, 18.2% in 1933, 16.6% in 1937 and 15.8% in 1940. Salaries and wages, indicative of labour return, accounted for 63.7% of total payments in 1929, 62.2% in 1933, 63.1% in 1937 and 63.4% in 1940.

The apparent decline in the importance of capital return occurred in part because of the rise in importance of relief and benefits (from 1.2% of total payments in 1929 to 4.0% in 1940), in part because of declining rates of interest not completely offset by a small increase in the volume of indebtedness, and in part because of the naturally smaller yields on equity investments at the lower levels of capacity utilization prevailing in the later years. Salary and wage payments were sustained partly by work-relief wage payments; if these are deducted, other salaries and wages in 1940 accounted for 61.2% of total payments, compared with 63.7% in 1929.

Size-Distributions of Income.—Studies of income size-distribution usually are designed to determine at least the number of individuals or consumer-units receiving incomes of different amounts. There are several uses for such figures. Some of these are examined briefly below.

The increasing importance of personal income taxes as a source of government revenue accounts for some of the growing interest in size-distribution figures. Because the political forces at work generally have been such as to mould the income tax structure in such a way that tax rates on larger incomes are higher than the rates levied against smaller incomes, a clear analysis of income in terms of the number of recipients having different amounts is a significant tool in estimating anticipated revenues.

Another and a collateral development has been the growing political interest in the possible existence of cause-and-effect relationships between income size-distributions and certain economic problems of current interest. It is recognized quite generally that the pattern of income utilization differs considerably at different levels of income—that recipients of large incomes usually save a greater proportion of their aggregate income and that this tendency to save affects the relative demand for consumers' commodities and services on the one hand and for producers' goods on the other. The argument is, that money income generally must be converted into commodities and services in some form, that monetary savings out of large incomes may exceed the demands of the business community for new capital, and that a situation of idle funds may be created, resulting in unemployment of man power and of existing capital assets. An understanding of income size-distribution is, of course, basic to studies following such lines of reasoning.

It also is generally recognized that the character of consumer commodities and services utilized by income recipients differs between individuals at different income levels. So-called luxury items are purchased principally by persons with higher incomes, while staple products claim a

Table II.—Size-Distribution and Utilization of Consumer Incomes in the U.S., 1935-36

*Personal income taxes, poll taxes, and certain personal property taxes.

larger proportion of amounts going to recipients of smaller incomes. The number of consumer units at different levels of income thereby is an important factor in the determination of the market for particular commodities and services.

While income is not an ideal or comprehensive measure of welfare, the economic community is so organized that income size is a very important element in the whole pattern of individual and family well-being. Many other economic studies, therefore, have been directed toward the determination of minimum living standards, which standards always are expressed in terms of the level of income necessary to insure their maintenance. No standard has been or can be readily determined, but these investigations served to provide another source of interest in size-distribution estimates.

Comprehensive studies of income size-distribution have not, however, been numerous. The last significant analysis of this type was published by the National Resources committee under the title of *Consumer Incomes in the United States*. A companion bulletin, *Consumer Expenditures in the United States*, provides information on income utilization at different income levels. The figures refer to the years 1935-36 and were developed from income data for 300,000 consumer units (plus income tax data for the higher incomes) and expenditures data for 60,000 units. Selected information from these two studies is given in Table II.

In 1935-36 more than two-thirds of the nation's consumer units had incomes of less than \$1,500 per year, and, in the aggregate, they paid out for current consumption, gifts and taxes considerably more than the amount of their income. In fact, nearly 80% of all expenditures for consumption were made by units with less than \$3,000 per year at their disposal, although the same units received less than 70% of the total income.

Savings in the income group \$1,500-\$3,000 per year were slightly more than the excess of outlays over income by recipients of smaller annual amounts, and savings equivalent to about 10% of the aggregate income for all units were effected by the 7% of those units enjoying incomes of \$3,000 or more per year. Income in excess of \$10,000 per year received by all units having more than that annual amount was equal to about 7% of the total income for all groups, or about \$9.00 per month for each consumer unit below the \$10,000 level.

The ratio of outlays for gifts and personal taxes to total income in the different groups advanced with the level of income principally because of the importance of income taxes levied at higher rates against the larger incomes. It should be noted, however, that more than half of the total of gifts and personal taxes for all groups is accounted for by units receiving less than \$3,000 per year. Actually the relative tax burden of the units at different income levels is not expressed clearly in these figures, because taxes levied in such a way that they are included in the prices of consumer goods are very important in the whole tax structure, but are not included in the tax outlays reported here.

Another recent study, one prepared for the Temporary National Economic committee under the title of *Concentration and Composition of Individual Incomes, 1918-1937*, provided figures illustrative of the changing proportion of aggregate income received by fixed percentages of income recipients (those receiving the highest incomes in each year). (See Table III.)

Concentration of income in the higher brackets appears to increase as total income experiences a cyclical expansion. This tendency is due in large part to the fact that recipients of large incomes receive a substantial proportion of their income in the form of return on invested risk-capital, or in the form of appreciation on such investments, and these types of income are much more variable than aggregate income of all types. The proportion of total income received by persons in the higher income brackets declines, largely for the same reason, when aggregate income decreases, and, over the 1926-37 span, there is no particular evidence in this study of a basic change in the degree of income concentration at the highest income levels.

State Distribution of Income Payments.—Income payments to individuals in the different states were estimated on an annual basis by the department of commerce. Variations between total and per capita incomes in the various states were substantial. In 1939, aggregate payments ranged from \$88,000,000 in Nevada to \$10,991,000,000 in New York, while per capita incomes (based on total population) ranged from \$203 in Mississippi to \$848 in Delaware. Figures of this type have been used to indicate the relative fiscal capacities of the different states and of the persons receiving their incomes therein. Data for 1939 are given in Table IV (estimates for 1940 will not be available before September 1941).

Distribution of Wealth.—No official estimates of national wealth or of its distribution have been made since the Federal Trade commission issued a report entitled *National Wealth and Income*, giving figures for the year 1926. The estimated value of national wealth there reported was \$353,000,000,000. This figure compares with an estimate of \$205,000,000,000 for 1912, but the increase over the ten-year period was influenced heavily by

price advances, as well as by quantity additions to physical assets.

The Federal Trade commission also reported data on the values of 43,512 decedents' estates during the 1912-23 period. This study showed that 1% of the estates held 59% of the total wealth of all of the estates analyzed and that more than 90% of the assets of all estates was accounted for by

about 13% of the estates. The data also tended to demonstrate a declining degree of wealth concentration over the period and a greater concentration in cities than in towns and rural areas. The sample of estates was very small, however, and it is unlikely that decedents' estates are entirely representative of the asset holdings of living persons, so the wealth-distribution significance of these figures is somewhat limited.

In the June 1927 issue of the *Journal of the American Statistical Association*, Dr. Wilford I. King gave estimates of the distribution of wealth among all property owners in the United States in 1921. He found that approximately half of the 41,000,000 property owners in that year (total population 108,000,000) owned assets worth less than \$2,500 each, and, in the aggregate, accounted for less than 10% of the total national wealth. The 10% of property owners who held assets worth more than \$10,000 possessed more than two-thirds of the total national wealth. The highest 2% of property owners claimed 40% of the total, and the highest 1% owned approximately one-third. (See also NATIONAL INCOME.)

Welles, Sumner (1892-), U.S. undersecretary of state, was born Oct. 14 at New York city and was educated at Groton (Mass.) school and at Harvard. He was secretary of the U.S. embassy at Tokyo from 1915 to 1917, was stationed at Buenos Aires during the next two years, and in 1921 became chief of the Latin-American affairs division of the state department in Washington. In 1922 he was U.S. commissioner to the Dominican Republic, and in 1924 he was President Coolidge's personal representative in Honduras, then in the throes of revolution. He was appointed assistant secretary of state April 6, 1933, and except for a short period as ambassador to Cuba in 1933 held this office until his appointment May 21, 1937, as undersecretary of state.

A polished professional diplomat with a fine admixture of tact and firmness, Welles achieved renown in 1940 during his "mission of peace" to Europe. He began this trip with a visit to Mussolini at Rome Feb. 26, then interviewed in rapid succession Ribbentrop, Hitler, Goering, Hess, Lebrun, Daladier, King George VI and Chamberlain. Before sailing for home from Italy March 20 Welles declared that he had neither presented nor received any plans for peace. The results of his mission remained cloaked in official secrecy.

Wellesley College in Wellesley, Mass., founded in 1870 by Henry Fowle Durant, occupies 400 ac. of rolling woodland bordering on Lake Waban. A four year liberal arts college enrolling approximately 1,500, Wellesley is pre-

eminently for candidates for the B.A. degree, but offers also the degrees of Master of Arts, Master of Science, Master of Arts in Education and a certificate in hygiene and physical education. The 199 faculty members offered instruction in 26 departments ranging from art to zoology in 1940. Conspicuous among activities in 1940 were the work of the college war relief committee and the housing and care of 74 British refugee children in a college residence during the late summer. Trust funds were \$10,535,-562.09; the value of the plant was \$11,131,960.19.

(M. H. McA.)

West Africa, British: *see* BRITISH WEST AFRICA.

Western Australia. A state of the Australian commonwealth; area 975,920 sq.mi.; pop. (est. June 30, 1939) 465,431. Chief town: Perth (pop. Dec. 31, 1939—including Fremantle) 224,800. Governor: (vacant); lieutenant-governor: Sir James Mitchell, K.C.M.G.

History.—The biennial elections for the legislative council were held on May 11. Sir Hal Colebatch, former agent-general for Western Australia in London, defeated one of the two retiring members who failed to gain re-election.

In some pastoral areas of the state, drought conditions continued in 1940 for the fifth consecutive year. The drought had been responsible for a decline of 50% in flocks in pastoral areas and the government appointed a royal commission to investigate the financial and economic position of the pastoral industry. Agricultural prospects were good although the season's crop was not expected to reach the high figure of 40,000,000 bu. harvested in 1939-40. In an effort to increase the production of flax to meet urgent defence requirements the state department of agriculture guaranteed farmers a gross return of £4 per acre and the commonwealth government was equipping a retting mill in the southwest portion of the state.

Payment of state income tax by instalments deducted from salaries and wages was made compulsory as from Aug. 1.

The state accounts for the fiscal year 1939-40 revealed a deficit of £147,000 compared with an estimated deficit of £31,000.

Finance.—Revenue (1938-39), £A10,949,660; expenditure, £A11,170,102; debt outstanding (Dec. 31, 1939), £A96,534,460.

Communication.—Roads (June 30, 1938) 29,722 mi. fit for motor traffic; railways (1938-39) government 4,378 mi.; motor vehicles licensed (1938-39): cars 38,039; trucks 24,441; cycles 7,199. Wireless receiving set licences (June 30, 1939) 79,262.

Agriculture and Manufactures.—Production: wheat (1939-40) 41,500,000 bu.; wool (1939) 72,475,000 lb.; gold (1939) 1,214,238 fine ounces. Industry and labour (1939): factories 2,129; employees 23,211; gross value of output £A19,548,511; unemployment (trade union returns) (Feb. 1940) 6.9%.

(W. D. MA.)

West Indies, an archipelago lying between Florida and South America, and including the Greater Antilles (Cuba, Hispaniola, Puerto Rico and Jamaica, with lesser dependent islands) and the Lesser Antilles (extending from the Virgin islands to Trinidad); languages, Spanish, English, French and Dutch. The area is approximately 99,000 sq.mi. The population (estimated at roughly 12,400,000 at the end of 1940) is three-fourths white and one-fourth Negroid in Cuba and Puerto Rico and 80% to 99% Negroid elsewhere except in Trinidad, where it is 40% East Indian. The West Indies includes three republics, two United States dependencies, and six British, two French and one Netherlands colony. During 1940, the most important developments centred around the activities of the United States in developing defences in the archipelago and around the plight of

the French colonies following the collapse of France in June. In normal times trade is chiefly with the United States and, in the European colonies, with their respective metropolises, but, under conditions prevalent in 1940, access to customary European markets and sources of supply was rendered difficult or else cut off altogether. In consequence, trade with the United States was stimulated. Imports are usually foodstuffs, textiles and manufactured goods; exports are sugar, chiefly, and other products of tropical agriculture, with Trinidad and Curaçao supplying petroleum products. Except in these two islands and in Cuba and Hispaniola, where there are undeveloped mineral deposits, resources are almost entirely agricultural. External communication is by sea, with Pan American Airways linking the main centres with other parts of America. The tourist trade is growing rapidly. (*See also* BAHAMAS; CUBA; CURAÇAO; DOMINICAN REPUBLIC; FRENCH COLONIAL EMPIRE; HAITI; HISPANIC AMERICA AND THE EUROPEAN WAR; PUERTO RICO; VIRGIN ISLANDS; WEST INDIES, BRITISH.)

West Indies, British. The several British islands in the West Indies; language, English. Politically, the islands are administered separately or in groups as British crown colonies: Jamaica; the Leeward islands, a loose federation of the presidencies, or colonies, of Antigua, St. Kitts-Nevis, Montserrat, Virgin islands (British); Barbados; Trinidad and Tobago; and Grenada, St. Lucia, St. Vincent and Dominica, otherwise separate colonies, but collectively called the Windward islands and administered under a common governor, who usually resides at St. George's, Grenada. In Jan. 1940, under authority of an act of parliament of March 30, 1938, Dominica was transferred from the Leeward islands administration to that of the Windward islands. (*See* map p. 210.)

Each colony has a governor or other chief executive appointed by the crown (for names of governors, *see* BRITISH EMPIRE), an appointed executive council and a partially-elected legislative council or assembly. Barbados has a representative legislature but not full responsible government, and is the only colony electing a majority of its legislative body. Suffrage and officeholding are generally restricted by property qualifications.

Table I.—Areas and Population of British West Indies

Colony	Area (sq. mi.)	Pop. (1939 est.)	Capital (with est. pop.)

History.—The main developments in West Indies history during 1940 centred about the recommendations of the royal commission on the West Indies as a result of its investigations in 1938 and 1939, and the British-United States agreement of Sept. 2, under which the United States was given naval and air-base rights in certain islands.

The West Indies royal commission (informally called the Moyne commission from its chairman, Lord Moyne), appointed

on Aug. 5, 1938, to investigate social and economic conditions in the West Indies, British Guiana and British Honduras, spent some months of investigation, and, on Feb. 16, 1940, a portion of its formal report was made public with its recommendations. Its main recommendations were for the establishment of a West Indies Welfare fund, financed by an annual grant of £1,400,000. In the field of social services, it urged improvement of educational facilities, the establishment of a unified health policy and betterment of housing conditions. Great stress was given to the acute problem of labour relations, with recommendations for a labour adviser, a system of wage boards and industrial courts, and consideration of unemployment insurance, improved factory regulations and workmen's compensation. In the economic field, the commission took cognizance of world overproduction of the West Indies' main agricultural products and the problem of increasing overpopulation, and after approving an increased sugar quota, gave qualified endorsement to government support of industrial enterprises. For agriculture itself, a centralization of agricultural policies and direction, and increase of agricultural education were recommended along with special soil surveys, and inquiries into various means of developing forms of agriculture best suited to the regions, with stress on the production of foodstuffs for local consumption, and development of a comprehensive land settlement program. Consideration was given to a proper communications policy. (See *Communications* below.)

The long-continued agitation for complete self-government based on universal suffrage was met by recommendation of political federation as an ultimate, but not immediate, end, with a greater actual participation of elected representatives and a substantial reduction in the qualifications required of elected members of legislative councils. Political federation, the commission felt, should first be given a practical test through merger of the Leeward and Windward islands administration, using the existing Leeward islands government as a model. Need for betterment of appointed administrative personnel was likewise stressed.

The Moyne commission's report was generally well received in both the United Kingdom and the West Indies, and its recommendations were the bases of the subsequent Colonial Development and Welfare act, passed by parliament in July. This act authorized sums for colonial research, and colonial development and welfare, with an immediate expenditure in the tropical American colonies of £350,000 through grants-in-aid, including £27,810 to the Windward colonies.

Sir Frank Stockdale, a veteran of colonial service, was appointed to the newly-created post of comptroller for development and welfare in the West Indies, and a single chief justice named for both the Leeward and the Windward islands as a tentative step toward eventual federation.

Of perhaps eventually equal importance to the West Indies was the development of a project under which the United States traded 50 destroyers to Great Britain for 99-year lease rights for naval and air bases in West Indian and certain other colonies. This was crystallized and formulated in an exchange of notes between the two governments on Sept. 2, under which Great Britain made available to the United States "for immediate establishment and use of naval and air bases and facilities for entrance thereto and protection thereof" sites on the western coast of Trinidad, in the Gulf of Paria, the southern coast of Jamaica, the western coast of St. Lucia and in Antigua (as well as certain sites outside the West Indies proper).

These were leased to the United States free of all charges other than those necessary to compensate owners of private property.

Numerous United States naval and other officials, including Secretary of the Navy Frank Knox, visited the West Indies during the remaining months of the year, and, in Dec. 1940, President Roosevelt himself made a tour of inspection. Some difficulties were encountered in the selection of a site on Trinidad, regarded by many as the most important location of all. United States officials objected to allocation for an air and naval base of a swampy area which colonial officials preferred because of its isolation from heavily-populated districts, and final adjustment had not been made by the close of the year. The sites chosen included Portland bight, with an adjacent land area on the southern Jamaica shore; a seaplane base at Parham sound, on the north-eastern side of Antigua; and a seaplane base at Gros Islet bay, St. Lucia, along with use of a large land area at Vieux Fort for a bomber patrol station. Preliminary work on the bases was begun immediately, and by mid-November United States naval patrols were operating from St. Lucia. Development of the four West Indian bases was estimated to cost a possible \$70,000,000.

The several West Indian colonies made numerous contributions toward the successful prosecution of the war against Hitler, in man-power, especially aviation personnel, in money and other economic resources, and in caring for evacuees. Under the leadership of a prominent newspaper, private sources in Jamaica raised in excess of £40,000 for the purchase of bomber planes. The government of Trinidad made an outright gift of £500,000 and an interest-free loan of £520,000, while private citizens raised £72,000 (including a single gift of £10,000) for aircraft purchase. In Barbados, the government contributed £125,000 for general war purposes, private groups over £25,000. Similar contributions were made by the Windward and Leeward islands colonies. Jamaica became host in August to nearly 4,000 civilian evacuees from Gibraltar.

Communications.—External communication is by steamship service, and Pan American Airways to Jamaica, Antigua, Barbados and Trinidad. Interisland communication is, in several instances, poor. The Virgin islands are reached by way of the United States. The Moyne commission recommended subsidizing a British passenger service from the outside and establishing a small, government-operated or subsidized interisland line, as well as a regular air service from St. Kitts to Trinidad covering the principal intermediate islands.

Kingston, Port of Spain and Bridgetown are important ports of call. Only Jamaica, with 210 mi., and Trinidad, with 123 mi., have railways. Roads are adequate for local needs.

Agriculture.—With the exception of Trinidad, where petroleum (1940 est., 20,300,000 bbl.) and asphalt dominate economic life, and in Barbados, where some small undeveloped petroleum deposits exist, the British West Indies lack mineral resources. Agriculture, along with the processing of its products (especially sugar), is almost the sole basis of economy except in Trinidad. A wide diversity of agricultural commodities is produced, but sugar, bananas, cacao and cotton are the most important.

In 1940, 290,658 ac. were planted in sugar, and the 1940-41 crop was estimated to provide 449,909 tons for export (Barbados, 126,425; Jamaica, 133,800; Trinidad, 114,390; Antigua, 29,000; St. Kitts, 36,500; St. Lucia, 9,694; St. Vincent, 100). A large portion of the sugar output is processed into rum and molasses.

Over 97% of the banana acreage (76,022 ac.) is in Jamaica. In 1939 Jamaica was the world's leading banana exporter, shipping 18,771,628 stems (23,811,337 stems in 1938), nearly 90% to Europe, but under war conditions exports in the first 11 months of 1940 totalled only 6,656,520 stems, and practically ceased after Great Britain embargoed fresh fruit shipments in Nov. 1940.

Table II.—Imports and Exports of the British West Indies, 1939
(with percentages of trade with the United Kingdom, Canada, and the U.S.)

Colony	Imports	U.K.	Can.	U.S.	Exports	U.K.	Can.	U.S.
Trinidad and Tobago . . .	\$34,762,954	35.6	14.5	25.5	\$37,481,438	41.5	9.8	4.8
Jamaica	£6,506,650	29.1	17.7	23.2	£4,704,746	40.7	13.1	11.8
Barbados	£2,445,753	35.4	17.6	15.9	£2,028,991	40.7	51.0	3.8
Grenada	£292,829	19.8	14.3	4.1	£310,687	33.4	13.8	2.0
St. Kitts-Nevis	£293,264		(not available)		£433,824		(not available)	
Antigua	£230,874		(not available)		£220,460		(not available)	
St. Vincent (1938)	£198,786	42.7	17.11	13.5	£210,642	39.8	7.7	35.3
St. Lucia (approx.)	£161,823	37.6	17.4	4.0	£117,201	24.6	37.9	3.8
Dominica	£109,594	37.6	20.0	14.5	£05,077	10.7	9.1	21.5
Montserrat	£49,301		(not available)		£54,540		(not available)	
Virgin Islands (1938)	£14,125		(not available)		£9,808		(not available)	

An area of 237,014 ac. is devoted to cacao (Trinidad and Tobago, 210,000 ac.; Grenada, 20,500 ac.). World overproduction is a serious obstacle to the industry, necessitating a quota system. In 1939 exports were: Trinidad, 7,479 tons; Grenada, 3,592 tons; Jamaica, 2,315 tons. Cacao comprised 4.5% of Trinidad's exports and 34.4% of Grenada's.

Coco-nuts (103,025 ac.) were important, especially in Trinidad and Tobago (52,500 ac.) and Jamaica (40,074 ac.). Jamaica led in their export, shipping 31,406,137 nuts in 1939, over 75% of the British West Indian total. St. Lucia, St. Vincent and Trinidad were next in export importance.

In 1939-40, 21,454 ac. were planted in cotton (mostly sea island). Production totalled 6,613 bales of 400 lb. (5,900 bales sea island), nearly 30% greater than in 1939 (St. Vincent, 1,775 bales; Montserrat, 1,500 bales; St. Kitts, 1,000 bales). Cotton made up nearly 80% of Montserrat's exports and 24% of St. Vincent's.

British West Indian coffee is mostly of a low grade. The "Blue Mountain" coffee of Jamaica, however, is one of the world's finest coffees. Jamaica produced 91.9% and Trinidad and Tobago 8% of the 9,090,635 lb. of coffee exported in 1939. In 1940, however, Trinidad's coffee exports more than doubled.

Citrus fruits, especially oranges, limes and grapefruit, are grown in most of the colonies, with 10,780 ac. in citrus groves in 1940 (1939, 8,970 ac.). Dominica, St. Lucia, Trinidad and Montserrat together accounted for most of the world's lime juice production. Limes and other citrus fruits (fresh or processed) made up 54% of Dominica's exports.

Fresh vegetables, notably tomatoes for the Canadian market, were extensively produced in the Leeward and Windward colonies. St. Vincent dominated world arrowroot production. The 1939 crop, 11,762,919 lb., an all-time record, accounted for 66.3% of the colony's export values.

Spices are important, especially in Grenada and Jamaica. Nutmeg (2,145 tons in 1939), mace and other spices made up a third of Grenada's exports. Jamaica was the sole source of pimento ("allspice"), exporting over 2,200 tons in 1939 and a heavy producer of ginger (1939 exports, 1,602 tons), but exports of both were halved in 1940.

Education.—In 1940 there were 1,338 elementary schools, with approximately 326,054 pupils in 1940, as well as secondary schools. Higher education is provided at Codrington college, near Bridgetown, Barbados, and at the Imperial College of Tropical Agriculture, at St. Augustine, Trinidad, one of the world's leading institutions of its kind.

Finance.—The monetary unit, except in Trinidad, was the pound sterling. The Trinidad dollar, officially valued at \$4.80 to the pound (approx. 84 cents U.S. in 1940), was legal tender in both Trinidad and Grenada.

Westmark: see GERMANY.

West Virginia, a state in the Appalachian mountain region in the eastern part of the United States, sometimes called the "Panhandle State," was formed from Virginia during the Civil War and admitted to the union, June 20, 1863. It has an area of 24,170 sq.mi. Its population in 1930 was 1,729,205 of which 1,613,934 were whites (51,520 foreign born). Its total urban population was 491,504. Its population in 1940 was 1,901,974. Its capital is Charleston (pop. 67,914). Its other chief cities are Huntington (78,836) and Wheeling (61,099). It has about 4,000 mi. of steam railway, 182 mi. of electric railway and a new and extensive system of improved highways (over 12,176 mi.).

History.—The chief state officers in 1940 were: governor, Homer A. Holt; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney general, Clarence W. Meadows; commissioner of agriculture, J. B. McLaughlin; superintendent of schools, W. W. Trent. All except the governor were re-elected in Nov. 1940. M. M. Neely was elected governor. The official count of the election of 1940 showed that Roosevelt received 496,146 votes and that Willkie received 372,662 votes. For governor of the state the vote stood 496,028 for M. M. Neely and 383,698 for D. Boone Dawson.

Other state officials (Democrats) were elected by majorities ranging from 141,745 for secretary of state to 112,000 for commissioner of agriculture. For U.S. senator Judge Harley M. Kilgore received a vote of 492,413 and Thomas B. Sweeney received a total of 381,806.

Education.—Education is free in the public schools for all children between six and 20 years of age and is compulsory for all between seven and 16. The pupil enrolment in the 5,026 state elementary schools for 1939-40 was 312,640. In the 386 state high schools it was 140,181. The number of teachers was 11,061

in the elementary schools and 5,117 in the high schools. The total state appropriation for elementary and secondary education in 1939-40 was \$14,073,765 (the general school fund, \$773,785).

MATTHEW M. NEELY, new Democratic governor of West Virginia, elected Nov. 5, 1940

The state supports seven teachers-training colleges which in 1939-40 had a total student enrolment of 3,464 and a total instructional membership of 323, and received state appropriations amounting to \$935,808. It also supports the West Virginia university which in 1939-40 had an enrolment of 4,221, a total faculty membership of 255 (besides 67 assistants and the staffs of the demonstration school, library, experiment station, extension, military and athletics) and a total income of \$2,384,654.

Banking and Finance.—On July 1, 1940, the total deposits of the 104 state banks and trust companies were \$142,706,065.42. The total deposits of the 78 national banks in the State were \$170,520,000.

The summarized finance statement of the state treasurer for the fiscal year 1939-40 is as follows:

Balance July 1, 1939	(all funds)	\$ 11,640,331.39
Receipts for 1939-40	{ (all funds)	106,637,894.28
	{ (transfers)	41,754,474.55
Total		\$160,032,700.22
Disbursements, 1939-40	(all funds)	143,561,802.42
	(transfers)	41,754,474.55
Balance, July 30, 1940		\$ 16,470,897.80

On July 1, 1940, the total state funded indebtedness was \$77,232,000; the total amount of outstanding state road bonds was \$73,982,000.

The total assessed value of all property in 1940 was \$1,838,783,059 (real estate, \$850,357,039; personal property, \$397,668,520; public utilities, \$590,757,500). The total federal tax was \$13,143,541.11. This includes tax on capital stock, transfer of estates, and property transfers by gifts. The total federal income tax collected for 1939-40 was \$10,965,842.88.

Industries.—In 1935 the oil production was 3,959,000 bbl. (which decreased to 3,847,000 bbl. in 1936 and 3,660,000 bbl. in 1937). In 1939 it was 3,587,000 bbl. and the natural gas production was about 150,000,000,000 cubic feet. In 1939 the coal production was 108,515,665 short tons and the coking operations produced an output of 80,310 tons. In 1937 the state had 2,654 reporting industrial establishments, which employed 243,257 persons and paid \$320,760,285 in wages. These plants had a total production of about \$983,352,477—indicating a considerable increase since 1931.

Agriculture.—The acreage, production and value of the chief farm crops during 1939 were as follows:

Acreage, Yield and Value of West Virginia Farm Crops in 1939

	Acreage	Yield	Value
Corn	491,000	13,904,000 bu.	\$10,215,620
Wheat	145,000	2,002,000 bu.	1,891,800
Oats	73,000	1,460,000 bu.	671,600
Buckwheat	15,000	248,000 bu.	183,520
Hay	684,000	728,000 tons	6,988,800
Apples		4,000,000 bu.	2,200,000
Potatoes	32,000	3,040,000 bu.	2,584,000

The number of farms by census of 1934-35 was 104,747 (acreage of 9,423,655), valued at \$237,643,860.

BIBLIOGRAPHY.—*W. Va. Bluebook* and various official departmental reports. (J. M. CA.)

Weygand, Maxime (1867–), French soldier. For his biography, see *Encyclopædia Britannica*, vol. 23, p. 552. On May 19, 1940 Weygand was appointed commander in chief of the Allied armies to succeed Gen. Gamelin (*q.v.*), at the moment when the defeat of France was imminent. Dismissing 15 generals, Weygand planned a "defence in depth" in a vain attempt to halt the German onrush after the invaders had routed the Allied troops from Flanders. When Pétain replaced Reynaud as premier, Weygand was named minister of defence in the cabinet. Here he remained through the armistice negotiations until Sept. 6, when he was "relieved" of his cabinet post and sent to Africa to deal with the defection of various French colonies to Gen. Charles de Gaulle (*q.v.*). His failure to return to Vichy in the succeeding months gave rise to speculation that he himself had decided to aid the "free French," but he vehemently denied the allegation in an interview early in December.

The rumours nonetheless continued to persist.

Whaling: see FISHERIES: *Whaling*; EXPLORATION AND DISCOVERY.

Wheat. World production of wheat in 1940, exclusive of Russia and China, was estimated at 3,977,682,000 bu. as against 4,270,000,000 bu. in 1939. The U.S. crop in 1940 was 816,698,000 bu., about 9% over the 1939 crop of 751,435,000 bu. and above the ten-year (1929-38) average of 754,685,000 bu. The Canadian 1940 crop was a near record, 561,104,000 bu., compared to 489,623,000 bu. in 1939. A number of countries withheld, as military secrets, data on supplies and production of foodstuffs. Table I, showing world production of wheat is, therefore, made up of unofficial as well as official preliminary and final estimates. The figures are in all probability the most dependable that can be obtained since they are from the bureau of agricultural economics of the U.S. department of agriculture, with adjustments to include the higher later estimates of U.S. production.

Table I.—World Production of Wheat in Major Areas, 1940 and 1939

	1940 bu.	1939 bu.
North America		
United States	816,698,000	751,435,000
Canada	561,104,000	489,623,000
Mexico	13,000,000	14,771,000
Total	1,390,802,000	1,255,829,000
Europe, excluding		
Russia and Danube basin	1,060,000,000	1,263,000,000
Danube basin	300,000,000	453,000,000
Total, excluding Russia	1,360,000,000	1,716,000,000
Asia, excluding China	750,000,000	738,000,000
North Africa	125,000,000	151,000,000
Total, Northern Hemisphere	3,604,682,000	3,869,000,000
Southern Hemisphere		
Argentina	200,000,000	110,453,000
Australia	100,000,000	210,110,000
Union of South Africa	14,000,000	15,310,000
Total, Southern Hemisphere	314,000,000	344,873,000
World total, excluding China and Russia.	3,977,682,000	4,270,000,000

A shortage of wheat, and other bread grains also, was general in Europe in 1940 owing to a poor season and the absence of imports. The Danube basin was short 153,000,000 bu. under the 1939 crop and it was estimated that no more than about 30,000,000 bu. of the 1940 crop would be available for export. The rest of Europe, outside of Russia and the Danube area, was short 203,000,000 bu. compared with 1939 production. Yugoslavia prohibited export of wheat in order to conserve the home supply. Although Russia has for several years published few production figures it was considered improbable that Europe could draw any 1940 wheat from Russia owing to a poor crop year in the U.S.S.R. Turkey prohibited export of wheat

Table II.—Wheat Production by States, 1940 and 1939

State	1940 bu.	1939 bu.	State	1940 bu.	1939 bu.
Kansas	123,848,000	111,657,000	Iowa	8,121,000	6,002,000
North Dakota	97,054,000	79,068,000	New York	7,996,000	6,382,000
Oklahoma	56,332,000	60,438,000	Maryland	7,566,000	7,352,000
Montana	56,070,000	51,473,000	North Carolina	6,132,000	5,100,000
Ohio	42,137,000	37,159,000	Kentucky	5,625,000	4,071,000
Washington	41,808,000	43,822,000	Tennessee	5,116,000	4,117,000
Illinois	40,155,000	41,472,000	Utah	4,861,000	3,680,000
Nebraska	34,821,000	36,376,000	Wyoming	3,410,000	2,812,000
Minnesota	32,069,000	22,108,000	South Carolina	2,688,000	2,415,000
Missouri	31,707,000	30,429,000	West Virginia	2,016,000	2,102,000
Indiana	30,147,000	27,612,000	Georgia	1,880,000	1,770,000
Texas	29,355,000	29,032,000	Wisconsin	1,743,000	1,350,000
South Dakota	26,221,000	18,900,000	New Mexico	1,720,000	3,782,000
Idaho	24,383,000	21,311,000	Delaware	1,406,000	1,206,000
Pennsylvania	18,789,000	19,421,000	New Jersey	1,316,000	1,170,000
Michigan	17,812,000	15,784,000	Arizona	819,000	805,000
Oregon	17,184,000	16,108,000	Nevada	483,000	412,000
Colorado	13,500,000	12,905,000	Arkansas	352,000	390,000
California	11,370,000	12,173,000	Maine	88,000	84,000
Virginia	8,403,000	7,685,000	Alabama	75,000	60,000

because of an insufficient 1940 harvest. No accurate figures have been available from China for several years, although China is a foremost producer of wheat.

The 1940 wheat situation in North America was one of mounting carry-overs and increased production. In the United States the carry-over July 31, 1940, was 284,000,000 bu., and with the larger 1940 crop it was estimated that the 1941 carry-over would be about 118,000,000 bu. over normal, which is 250,000,000 bu. In Canada the carry-over July 31, 1940, was 300,741,062 bu. This with the large crop of 1940 gives a total Canadian supply of 861,845,062 bu. Exports, it was estimated, would take 180,000,000 bu. of this amount and Canadian consumption 130,000,000 bu., leaving a prospective carry-over July 31, 1941, of 551,845,062 bu. Owing to the huge supplies and to the restricted wartime markets in Europe, governments of the United States, Canada and other export countries took measures to aid wheat growers. The 1940 wheat crop year did not end in Argentina until the harvest that was finished in Jan. 1941. Stocks in Argentina were very low in 1940 owing to a huge reduction in acreage because of restricted export markets. Estimates of the crop harvested in Dec. 1940 and Jan. 1941 were 180,000,000 bu. to 200,000,000 bu., and it was believed that Argentina would have an export surplus of 100,000,000 bu. at the end of the crop year. Of this 38,000,000 bu. was earmarked for Brazil. Owing to drought the 1940 crop year production in Australia was placed at only 100,000,000 bu., with 45,000,000 bu. available for export.

The 1940 crop in the United States, Dec. 1 estimate, consisted of 227,547,000 bu. of spring wheat and 589,151,000 bu. of winter wheat; the 1939 crop, 181,694,000 bu. of spring wheat and 569,741,000 bu. of winter wheat; the ten-year (1929-38) average, 183,619,000 bu. of spring wheat and 571,067,000 bu. of winter wheat. Table II shows the estimated production, all varieties, by states, in 1940 and 1939. The seeding of winter wheat in the United States in the autumn of 1940, for harvest in 1941, was estimated at 46,271,000 ac. (See also CEREALS; FLOUR AND FLOUR MILLING). (S. O. R.)

Wickard, Claude Raymond (1893–), U.S. secretary of agriculture, was born near Delphi, Ind. on Feb. 28.

After his graduation from Purdue university in 1915 he took over management of a farm near his birthplace. In 1933 he was appointed to the staff of the Agricultural Adjustment administration as assistant chief of the corn-hog division.

He advanced to chief of the division in 1935 and later became director of the AAA's conservation program for the north central states. On Feb. 1, 1940 he was appointed undersecretary of agriculture, and on Aug. 19, after the resignation of Henry A. Wallace (*q.v.*), President Roosevelt nominated him secretary of agriculture. Wickard declared after his nomination that he intended "to carry out the policies of Henry A. Wallace," his predecessor in the cabinet.

Wild, Horace B. (1879?-1940), U.S. airman, was born in Chicago and as a boy was interested in kites and balloons. He built an airship in 1905 and made many successful flights in gliders. He worked with Octave Chanute on his glider experiments in Indiana before he built his own. In 1905

he sailed in a balloon from Chicago to Lake Kiskiskawim, N.S., 925 mi., and made a successful landing. He made about 1,800 flights, 75 of which were in Europe. He died in New York city, July 23.

Wild Life Conservation. A convention on nature protection and wild life preservation in the western hemisphere, drafted by a committee of experts from the 21 American republics, was approved and recommended for signature by the governing board of the Pan American union, as a result of the sessions of the Eighth American Scientific congress held in Washington, May 10 to 18, 1940. The convention, in 12 articles, provides for international agreements and co-operation "to protect and preserve in their natural habitat representatives of all species and genera of their native flora and fauna, including migratory birds, in sufficient numbers and over areas extensive enough to assure them from becoming extinct through any agency within man's control" and "to protect and preserve scenery of extraordinary beauty, unusual and striking geologic formations, regions and natural objects of aesthetic, historic or scientific value, and areas characterized by primitive conditions."

In conformity with the recommendation of the governing board the plenipotentiaries of six Latin American governments and the United States signed the convention at the Pan American union in Washington, Oct. 12. The Latin American signatories represented Cuba, El Salvador, Nicaragua, Peru, Venezuela and the Dominican Republic. Several other governments signified their intention to sign the convention, which would come into force three months after the deposit of not less than five ratifications with the Pan American union. Any contracting government might at any time denounce the convention by notification in writing addressed to the Pan American union, but no denunciation should take effect until the expiration of five years from the date of the entry into force of the convention. The convention, marking a long step forward, will supplement but not supplant the more formal treaties for the protection of migratory birds between the United States and Canada, and the United States and Mexico now in force.

Federal Aid to States.—The Federal Aid to Wild Life Restoration act (50 Stat. 917), known also as the Pittman-Robertson act, which became effective on July 1, 1938, justified expectations as a measure destined to be of incalculable benefit in building up the supply of game animals and game birds. The act authorized operating appropriations of not to exceed the annual revenue from the 10% tax on sporting arms and ammunition. This tax has yielded some \$3,000,000 annually.

The initial appropriation under the act was \$1,000,000; and for the fiscal year 1940 \$1,500,000 was made available. Owing to expansion of the program the amount set aside by congress for federal aid was increased to \$2,500,000 for the fiscal year 1941. Forty-three states had received approval for 310 projects up to June 30, 1940. Seventy-five of these projects are completed. The latest estimates of the migratory waterfowl population of the United States by the fish and wild life service indicate that it has doubled during the past six years, increasing from less than 30,000,000 in 1934 to more than 65,000,000 in 1940. Owing to the evidence of increase in ducks the 1940 open season for hunting was extended to 60 days. The daily bag limit of 10 ducks remained unchanged, but of geese, which apparently need more protection, was reduced from four to three. Losses of woodcocks during the unusually cold weather in the south last winter were severe, and for that reason the open season for these birds was reduced to 15 days. The new regulations became effective when approved by the president on recommendation by the secretary of the interior. (See also BIRD REFUGES; FISH AND WILD LIFE SERVICE.)

(E. A. G.)

Willkie, Wendell Lewis (1892—), Republican candidate for the presidency of the United States in 1940, was born Feb. 18 in Elwood, Ind., the son of Herman Francis Willkie and Henrietta Trisch Willkie. After graduating from the University of Indiana with an A.B. degree in 1913 he taught history in the high school at Coffeyville, Kan., attended Oberlin college for a short time in 1915, then became a laboratory assistant in a Puerto Rican sugar plant. In 1916 he received his law degree from the University of Indiana and joined his father's law firm in Elwood. On the day in 1917 that the United States entered the World War, Wendell Willkie enlisted; in France he became a captain in the 325th field artillery and after the armistice he continued in service to act as counsel for enlisted men who had been court-martialled. Meanwhile, on Jan. 14, 1918, he had married Edith Wilk of Rushville, Ind.

Back in civilian life, Willkie worked for a short time in the legal department of the Firestone Tire and Rubber company in Akron, O., then joined the law firm of Mather and Nesbitt in that city.

Among Willkie's legal clients was an Ohio utilities company, and through this relationship he was persuaded in 1929 to go to New York city as a member of the legal staff of Commonwealth and Southern, a large utilities holding company with operating units in 11 states. Four years later he was president of the company. In this \$75,000-a-year office he more than doubled the amount of electricity sold by the company. He also entered into a controversy with the Tennessee Valley authority (which had set up extensive power developments in competition with Commonwealth and Southern) and attracted national notice and considerable sympathy for the cause of public utilities. Always ready to concede the need for proper control of utilities, he presented his arguments against excessive governmental regulation in such a logical manner that he became known, in the words of one publication, as the "most articulate" of the New Deal's critics, and, by 1939, as a potential candidate for president.

His nomination for the presidency by the Republican convention June 28, 1940, in the face of much opposition by regular politicians, was described as a "miracle." (For a fuller account of the campaign and the election, see REPUBLICAN PARTY and ELECTIONS.) His campaign was an unusually active one. Although he was defeated by a substantial margin in the election of Nov. 5, the 22,333,801 votes cast for him exceeded the largest number ever cast for a presidential candidate except Franklin D. Roosevelt. After the election, Willkie retired to private life (he had resigned as president of Commonwealth and Southern) and issued a call to his followers to co-operate in national unity.

Wills, C. Harold (1878–1940), U.S. engineer, was born in Fort Wayne, Ind., June 1, and went to work in a machine shop when he was 17. He became chief engineer of the Boyer Machine company and was later employed by the Ford Motor company, becoming its chief engineer and manufacturing superintendent. He designed the Model T car and every other model of the company until 1919. He then began to build automobiles in his own plant. He died in Detroit, Dec. 30.

Wines. The disturbed conditions due to the war in the principal wine growing countries of Europe made it difficult, if not actually impossible to report satisfactorily on the wine vintages of 1940. France, the principal wine-growing country of the world, was largely under foreign military control and it was impossible to secure any authentic information regarding the success or failure of the 1939 vintages in Bordeaux, Cognac or the

Burgundy and Champagne districts. Even from that portion of France which was unoccupied, the information secured was meager and it was quite impossible to ascertain any details regarding either the quantity or quality of the wines harvested in the fall of 1940. The reports from Italy, second only to France in the extent of its wine production under normal conditions, were likewise meager. From such information as it was possible to secure, 1940 will have to be classed as an unsatisfactory year in point of quantity and in many instances also of quality.

From Bordeaux it was impossible to secure any reliable information, and whether any of the 1940 vintage will be available from Château Lafite, Château Latour, Château Margaux, Château Yquem or any of the other many choice wines of the Bordeaux section, time alone can tell. The conditions prevailing in the Burgundy district were likewise unknown. Millions of bottles of choice vintages of champagnes were taken from Reims and Epernay to Germany, either for eventual consumption there or perhaps to be used for trading purposes at the conclusion of the war.

From the Mediterranean coast of France, which was in the unoccupied zone, the information secured showed that the wine harvest in that part of France varied considerably in point of quantity, none however reaching the normal average, while on the other hand, the quality appeared to have been very satisfactory.

From Spain which finally emerged from its own civil war, it was learned that conditions, at least in the wine growing sections, were becoming more settled. However, because of heavy rains up to the end of June, the vines in southern Spain suffered heavily from mildew and the vintage in some districts was a failure. On the other hand, other sections of Andalusia where sheries are grown, fared somewhat better, but the small quantities produced with a growing demand for export requirements, greatly increased the prices on all grades. Catalonia in the northeastern section of Spain, reported an excellent wine crop for 1940 in respect to both quantity and quality. As a result of favourable atmospheric conditions, the grapes ripened well and the wines look very promising.

In Portugal the weather during the early part of the year was favourable, but rains in April and May, followed by a period of great heat in the summer and early fall made considerable inroads on the crops. However, on the whole, the vintage, while uneven, was satisfactory. The production of port wines for 1940 fixed by government control was 40,000 pipes of wine, precisely the same as in 1939; the balance produced being used largely for the distillation of brandy. The port wine market of course suffered as a result of the loss of Norway, Sweden, Holland, Belgium and France, all of which were important outlets for its products, its principal markets being Great Britain, Canada and the Americas.

The Madeira islands, because of unfavourable weather in spring and early summer, and the failure on the part of some growers to treat their vines properly, produced only 12,000 to 14,000 pipes of wine in 1940 against 20,000 pipes in 1939, 17,000 in 1938 and 20,000 in 1937. Those growers who treated their vines properly were well compensated for their labour by the excellent qualities of the year's vintage in the Madeira islands.

From Italy and Germany, no authentic reports were obtainable, and except for Greece and Hungary, the rest of Europe is of little importance so far as wine production is concerned.

Algeria, a French colony, was the only country in Africa producing substantial quantities of wine. The product of that country is wholesome and sound, and the quantities are reported this year as satisfactory.

United States.—The vintages in 1940 in California were the largest since the repeal of national prohibition in Dec. 1933. The California crop was estimated at approximately 95,000,000 American gallons, and the total wine production in the U.S.A. was well over 100,000,000 gallons.

Since the conditions of soil and climate in the United States do not vary as sharply from one year to another as they do in Europe, the quality of the grapes from year to year is fairly uniform. However, decided improvements were made in the methods of wine production and it was believed that American wines, largely because of the present European conditions, would take a more prominent place than ever before.

South America.—In South America, the Argentine republic and Chile are the principal wine producing countries, but due to the fact that they are below the equator, their wine crops are gathered in the spring. The 1940 wines showed a higher alcoholic content than in normal years.

Germany was, prior to 1940, the principal buyer of South American wines. The interruption of this traffic of course reduced the export of these wines and made it advisable for both countries to seek other markets.

Africa and Australia.—The Union of South Africa and Australia both produced wines in fairly substantial quantities, but the lack of shipping opportunities due to the war greatly impaired their export business and left large quantities of the 1939 and 1940 production undisposed of in the countries of origin.

In brief, 1940 will go down in history as an uncertain and on the average, an unsuccessful vintage year. In some countries the harvests were fairly satisfactory, but on the whole, the outlook for 1940 wines was unfavourable and 1937 will still have to be depended upon, so far as the wines of that year are obtainable, for vintages of really outstanding quality.

(A. W.)

Wisconsin, a north-central state, the 30th state to enter the union and the fifth and last to be created under the Ordinance of 1787, is known zoologically as the "Badger State." It has an area of 56,066 sq.mi. and the population, census of 1940, was 3,137,587, making it number 13 in rank among the 48 states. The increase in ten years was 6.8%. The capital is Madison, population (1940) 67,447. Estimated number of males 21 to 35 years of age, 387,000. Of these, Milwaukee, the metropolis, has 87,300 in a total population of 587,472 against 578,249 in 1930. In 1930 the rural population, 1,385,163, contained only 866 Negroes and 10,716 of "other races," which means Indians settled upon reservations. Native whites of native parentage constituted 44% of the whole rural element, native whites of foreign parentage 40.5%. Urban society showed 35.7% native whites of native parentage against 43.4% native whites of foreign parentage. The foreign-born made up 20.4% of urban, 14.8% of the rural population.

History.—In the presidential election Roosevelt (Dem.) received 704,821 votes, Willkie (Rep.) 679,206, Thomas (Soc.) 15,071, Browder (Comm.) 2,394, Babson (Proh.) 2,148, Aiken (Soc. Lab.) 1,882. The 11 electoral votes of Wisconsin were given to Roosevelt by a smaller majority than in 1936 and 1932. Robert M. La Follette, Jr., (Prog.) was returned to the United States senate by a plurality vote, his Republican opponent, Fred M. Clauson, trailing by some 45,000 and the Democratic contender being left far behind. In the three-cornered race for the governorship the Republican incumbent, Julius P. Heil had the plurality, Orland S. Loomis, the Progressive candidate running second and Francis E. McGovern, Democrat, third. Again, as in the session of 1939, the Republicans would control both houses of the legislature, but by more impressive majorities.

Hygiene and Corrections.—The 1937 legislature carried out the governor's recommendations in changing a number of three-man commissions to departments each with a director. Sub-directorships were then created to care for divisions of the departments, all responsible to the director. The public welfare department has six such divisions. On the whole, experience under this reorganization has been satisfactory, the only serious criticism of it being that directors under the law are not subject to civil service regulations. Selection of sub-directors, in most cases, has given satisfaction to citizen groups most closely identified with the work of the divisions.

A change in the law respecting the university board of regents, which permitted the governor to reconstitute that important board, was criticized at first as bringing the university into politics, but by Jan. 1, 1941 there was no evidence that the new board was concerned with matters other than the purely educational. The reorganization was brought about on the argument that Governor Philip F. La Follette had "packed" the board for the purpose of removing the then president, Dr. Glenn Frank. That board, however, appointed Dr. Clarence A. Dykstra to the presidency and he had the cordial co-operation of the new board.

Agriculture, Manufacturing and Mining.—Wisconsin's 200,000 farms averaged approximately 117 ac., the most numerous classification being that between 70 and 99 ac., the least numerous

that of 1,000 ac. and over. Of the latter there were, in 1935, only 131, of the former, 49,332. There were 2,060,000 cows on the farms, producing in 1938 an average of 5,700 lb. of milk, the aggregate being 11,862,000,000 lb. In 1939 this aggregate was 11,973,000,000 lb. Wisconsin stood first among the states in aggregate amount of milk, also in the amount of cheese products. All cattle on farms, Jan. 1, 1940, were valued at \$195,238,000 as against \$183,867,000 one year earlier. (See also ALFALFA; APPLES; BARLEY; BEANS, DRY; BUCKWHEAT; CORN; GRAPES; HAY; OATS; POTATOES; TOBACCO; WHEAT.)

All coal, petroleum, pig-iron, copper, asphalt, sulphur, salt, phosphate, glass and rubber used in Wisconsin industries were imported, but there was some production of crude zinc, copper and iron. In manufactures the state was ranked 11th in the union. There were 2,347 factories employing seven or more workers, but one-fourth of the factories employed three-fourths of the workers. Machinery, motor vehicles and paper production led. (See FARM MACHINERY.)

Labour Relations.—Certain features of the 1939 labour relations act were upheld by the state supreme court, but the opposition to the act on the part of union labour did not subside and other legal contests are promised. The new board reported that labour disputes were fewer than before the reorganization. In the year ending June 30, 1940, the board settled 178 controversies affecting 31,983 workers as against 847 cases brought before the old board in the period of 19 months from May 1, 1937 to Nov. 30, 1938. Requests to the board for assistance came equally from unions and from employers. (J. Sc.)

Wisconsin, University of. Regular session enrolment (1940-41) totalled 11,397, about the same as the preceding year, making Wisconsin the eighth largest university in the U.S. Total enrolment, including both regular and summer session, extension and short course registrations, reached a new high of 47,773 in the year.

The university was projected into the national defence program during the year. Its president, C. A. Dykstra, was lent to the federal government to act as director of the nation's first peacetime selective service law, under which about 3,500 of the university's men students were registered. A faculty committee for research on national defence drew up and filed with the national defence research committee in Washington, D.C., a 300-page report outlining research projects, personnel and facilities available at Wisconsin which would be helpful in the U.S. defence program. The university also co-operated with the federal government's Civil Aeronautics authority, with 750 students enrolled in its pilot-training courses during 1940-41.

A new law library building, the four-story McArdle Memorial cancer research laboratory, and a five-unit dormitory housing 450 women students were new buildings completed and put into use on the campus during the year. Plans were also made for new chemical and electrical engineering buildings, a dairy building, and a new dormitory for farm short course students.

The largest number ever to graduate from Wisconsin in the university's 91-year history, more than 2,000 young men and women received their first and higher degrees at the school's 87th commencement in June. (R. Fs.)

Wolfe, Humbert (1885-1940), British poet and playwright, was born in Milan, Italy on Jan. 5 and was educated at Wadham college, Oxford. He entered the civil service in 1908 and rose to the post of deputy secretary of the ministry of labour. His first publication was a volume of sonnets in 1920. He published many other volumes of verse and wrote literary criticism and plays. He was made a Companion of the Bath in

1925 in recognition of his literary achievements. He died in London, Jan. 5. See also *Encyclopædia Britannica*, vol. 23, p. 696.

Woman's Christian Temperance Union.

The fact that more than 32,500 women joined the organization in 1940, that similar increases were made in the two branches, the Youth's Temperance council and the Loyal Temperance legion, is warrant that there was increasing interest in the organization's work that year. One thousand and ten new unions were formed, which means that many new centres to work out the objectives sought—total abstinence from alcoholic beverages, and the abolition of the liquor traffic. The five seminars on alcohol education sent 50 trained specialists into teachers' colleges. Three motion pictures were in circulation. These dealt with the scientific, social and economic effects of alcohol. They were on high school and adult levels. Film strips for classroom use in the grades, dealing with health, safety and economics, were available. Exhibits and many varieties of visual demonstrations were but a few of the special features of the year. The weekly magazine, *The Union Signal*, a journal of social welfare, and the *Young Crusader*, a children's paper, were increasingly added to libraries, both public and school. Books and pamphlets were printed in excess of any other year.

The great contribution of 1940 to the educational program of the organization was the erection of a building to house the expanding library on alcohol research as a centenary memorial to Frances E. Willard.

The national officers in 1940 were: Mrs. Ida B. Wise Smith, president; Mrs. D. Leigh Colvin, vice-president; Mrs. Anna Marden DeYo, corresponding secretary; Mrs. Margaret C. Munns, treasurer; and Mrs. Nelle G. Burger, recording secretary. National headquarters, Evanston, Ill. (I. B. W. S.)

Women's Clubs, General Federation of.

The General Federation of Women's Clubs was organized in New York city in 1890. Sixty-one clubs were represented. Today the federation embraces 15,000 clubs with a membership of 2,000,000 women, including 85 clubs in 32 territories and foreign countries. The organization was granted a charter by the United States government in 1901.

Among activities of 1940 were: a two-months' good neighbour tour to South America; continued study of South American republics; study of "the purposes of education in American democracy"; development of a platform for consumer-business relations; a weekly consumer broadcast and a bi-monthly radio program, "Echoes of History"; promotion of public health projects; co-operation with the White House conference on children in a democracy and the National Defense council.

"Adjusting Democracy for Human Welfare" is the theme of the incumbent administration. The officers for the term 1938-41 are: Mrs. Saidie Orr Dunbar, president; Mrs. John L. Whitehurst, first vice-president; Mrs. LaFell Dickinson, second vice-president; Mrs. Horace B. Ritchie, recording secretary; Mrs. J. L. Blair Buck, treasurer. The federation owns its headquarters at 1734 N Street, N.W., Washington, D.C. (S. O. D.)

Wood, Robert E. (1879-), U.S. soldier and business executive. He was born June 13 at Kansas City, Mo., graduated from West Point in 1900 and saw active service in the Philippines during the next two years. From 1905 to 1915 he was assistant chief quartermaster and chief quartermaster and director of the Panama Railroad company during the construction of the Panama canal. He left the army to engage in

private business in 1915 but returned upon the United States' entry into the World War in 1917 and was promoted to brigadier general. In 1918 and 1919 he was acting U.S. quartermaster general, and in the latter year he re-entered business as vice-president of Montgomery Ward & Co. in Chicago. He was vice-president of Sears, Roebuck and Co. in Chicago from 1924 to 1928, president from 1928 to 1939, then chairman of the board.

General Wood, who supported Roosevelt in 1932 and 1936, parted ways with the new deal in 1940 because of the administration's foreign policy. Believing that "all-out" aid to Britain would weaken U.S. defences and threaten to involve the nation in war, he organized the America First committee to oppose the U.S. intervention in the European conflict.

Wood, Spencer Shepard (1861-1940), U.S. naval officer, was born in Brooklyn, N.Y., Aug. 7, and was graduated from the United States Naval academy in 1882. He was promoted through various grades until he reached the rank of rear admiral in 1917. In 1894 he was sent to the Hawaiian islands by President Cleveland to investigate conditions with a view to the recognition of their government. He served as executive officer or commander of various warships and as commander of a fleet. He received the navy cross and several medals. He died in New York city, July 30.

Wool. Estimates of sheep in the world during 1940 were figured at 740,000,000, growing 4,010,000,000 lb. of wool. The Australian clip was computed at 1,036,000,000 lb.; South America, 606,000,000 lb.; United States, 487,000,000 lb.; New Zealand, 330,000,000 lb.; Union of South Africa, 261,000,000 lb. United States imports of apparel wool totalled 158,500,000 lb. in the first ten months compared with 72,000,000 lb. during the same period in 1939. As of Nov. 30, the U.S. domestic mill consumption of wool amounted to 605,000,000 lb., compared with 624,216,000 lb. for the 11 months in 1939. It is estimated that 160,000,000 lb. of grease wool were required, solely for the U.S. army, in orders placed from June 1 through October for defence purposes. The bulk of these U.S. orders specified the use of wools grown in the United States, but on Nov. 7 invitations for future bids were on three bases: all domestic wool; part domestic part foreign; all foreign. Due to conditions in the warring nations, it was impossible to secure accurate figures as to their wool consumption.

In Sept. 1939 the government of the United Kingdom purchased the entire Australian and New Zealand wool clips for the duration of the war and one year afterwards. In Sept. 1940 the wool clip in Cape Colony was placed under similar control. The British control board allocated in Dec. 1939, 75,000,000 lb. of Australian wool to the United States of which, to Nov. 30, 1940, 51,000,000 lb. were purchased. On Dec. 9, 1940 the British Wool Control board requested the Australian Central Wool committee to suspend the allocation for sale to any country, including the U.S.A., of wools below 66s quality and good topmaking fleece types unless containing more than 4% burr. This temporary suspension was caused by shortage of these wools in the United Kingdom.

On Dec. 10, 1940 details of the agreement between the United States and Great Britain for the acquisition by the United States government of a stock pile of 250,000,000 lb. of Australian wool to be held in the United States as a strategic reserve against possible emergency shortage of wool in the United States, were made public by the state department in an exchange of notes between Lord Halifax, British foreign secretary, and the American chargé d'affaires at London. Under the agreement the wool is to be transported to the United States and stored in bonded warehouses. The cost of transportation, on British shipping lines, is to be met by the United States, the United Kingdom retaining title to the wool. All or any part may be purchased by the United States or sold in the United States domestic trade upon a determination that an emergency shortage of wool exists. The agreement also provides that the United Kingdom may withdraw wool from the reserve if needed in case of shortage in empire territories or interruption of wool textile production in the United Kingdom for the manufacture of textiles in the United States to meet the United Kingdom emergency textile requirements, provided the reserve in the United States is temporarily depleted at no time more than 20% by such withdrawals. The strategic reserve is to be composed of 270,000 bales 58s/60s; 480,000 bales of 60s and finer; balance to be 60s and finer of good to average Bradford styles; two-thirds of all the 60s and finer wools to consist of 64s/60s.

The price of 64s/70s Australian wool averaged 63 cents clean cost in bond with U.S. territory fine staple at 94 cents scoured basis during 1940. The first sales by auction in Boston, Mass., of domestic wools were held during October at which time 4,428,125 lb., or 94% of the offerings, were sold at an average price of 32.62 cents a pound. Sales of wool top on the New York Wool Top Exchange to Dec. 1, were 150,450,000 lb. compared with 109,100,000 lb. for the same period in 1939. At the close of the year the total stock of apparel wool on hand in the United States was estimated at 324,000,000 lb. in comparison with a normal carry-over of 359,000,000 lb.

The Wool Products Labelling act of 1939 was passed by both houses of congress and signed by President Roosevelt to become effective as of July 14, 1941. After that time merchandise containing wool must be labelled, showing the percentage of the total fibre weight which is represented by wool; reprocessed wool; re-used wool; each fibre other than wool, if 5% or more; aggregate of all fibres other than wool; weight of any non-fibrous "loading," "filling" or "adulterating" matter. (See also TEXTILE INDUSTRY.) (C. M. AN.)

Work Projects Administration. The table shows employment on projects financed by WPA, 1938-40. The sharp decline in Aug. and Sept. 1939 was due to the heavy layoffs forced by the new law. In July 1939 there were laid off 342,157, and in August 678,621. The effect of increased employment due to European war orders and the U.S. defence program, began to appear in the figures given for 1940. Howard O. Hunter was in 1940 the acting commissioner.

Employment on Projects Financed With WPA Funds, United States and Territories, by Month, 1938-40

Month	Number Employed on Projects 1938	Number Employed on Projects 1939	Number Employed on Projects 1940
January	1,900,625	2,805,125	2,203,000
February	2,075,492	2,955,022	2,203,000
March	2,445,415	2,882,722	2,204,000
April	2,581,897	2,620,314	2,125,000
May	2,678,223	2,457,901	1,963,000
June	2,806,931	2,420,741	1,734,000
July	2,666,832	2,143,059	1,639,000
August	3,085,762	1,778,140	1,684,000
September	3,136,505	1,710,870	1,602,000
October	3,253,623	1,825,722	1,766,000
November	3,193,658	2,023,551	1,799,000
December	3,002,241	2,109,000	1,859,000

Wrestling Amateur wrestling continued to progress in the colleges, schools and clubs, and what was once professional wrestling continued to lose the interest of spectators. There was a move under way to establish honest wrestling in Madison Square garden, New York, under the Australian plan, which calls for ten-minute rounds, with a judge and a referee to award points. A fall would count much the same as a knockout would in boxing. The national A.A.U. wrestling championships, held at Iowa State college, Ames, Ia., attracted 90 of the leading wrestlers from every section of the United States. The team title for the total of nine weights was awarded to the West Side (N.Y.C.) Y.M.C.A., displacing the New York A.C. team, winners of the previous annual fixture and defeating the Baltimore Y.M.C.A. by one point. The National Collegiate Athletic association team title was won by Oklahoma A. and M. The Aggies scored 24 points, 10 ahead of Indiana, with Michigan third with 10 points. Lehigh won the eastern crown. (J. B. P.)

Wyoming, a Rocky mountain state, was admitted to the union July 10, 1890, as the 44th state. Leadership in the extension of rights to women gave it the name "Equality state." Wyoming has a land area of 97,548 sq.mi. The state is second in average elevation with approximately 6,700 ft.

According to the 1940 census, it had a population of 250,742, representing an increase of 11.2% in ten years. The capital city, Cheyenne, remained the largest city, with a population of 22,474.

History.—Elective state officials in 1940 were: governor, Nels H. Smith (R.); secretary of state, Lester C. Hunt (D.); auditor, William Jack (D.); treasurer, Mart T. Christensen (R.); and superintendent of public instruction, Miss Esther Anderson (R.). The Republican party had control of administrative boards. The legislature did not meet in 1940, although there were efforts to secure the call of a special session for the purpose of appropriating relief funds.

In the November general election the Republicans retained control of the state senate, but were forced to take a position of equality in the state house of representatives, since 28 Democrats and 28 Republicans were returned. The state voted Democratic in the national election, giving Roosevelt 59,287 votes; Willkie 52,633; Babson 172; Thomas 148. Senator J. C. O'Mahoney was re-elected to the U.S. senate with the largest majority ever given a Wyoming candidate—more than 19,000—despite the fact that his Republican opponent, Milward Simpson, carried on one of the most active campaigns in the state's history. In the congressional election John J. McIntyre (D.) defeated Rep. Frank Horton (R.). Many celebrations were held in July in honour of Wyoming's 50th year of statehood.

Education.—The University of Wyoming, the only institution of higher learning in the state, had a 1940 fall quarter enrolment of 2,110. The university was granted a charter of Phi Beta Kappa. A comptroller was named to assume the financial and business management of the university. High school attendance in the fall of 1940 was 15,080.

Mineral Production, Ranching, Manufactures, Agriculture.—Principal producing agencies of the state turned out products worth \$262,000,000, representing an increase of more than \$20,000,000 over the production of the same industries in 1939. Mineral production ranked first with approximately \$173,395,000. Of this petroleum was valued at \$152,420,000. Coal production was valued at \$16,000,000; iron, \$3,000,000; bentonite, \$1,500,000. Petroleum production was nearly 27,000,000 bbl., an increase of almost 4,000,000 bbl. over 1939.

Livestock production was second with a value of \$44,195,000. Wyoming cattle sold for \$19,000,000; sheep, for \$11,000,000; wool, for \$10,000,000; horses and mules, for \$1,000,000; and hogs, for \$600,000. The value of livestock production showed an increase of 30% over 1939.

Manufacturing, excluding oil refining and dairying, produced goods valued at \$25,000,000. Principal products were timber products, metal products, souvenirs, beverages and sugar.

Despite drought conditions in some sections of the state, Wyoming's major agricultural crops showed gains in production ranging from 5% to 53% over 1939. Alfalfa hay increased 12% to 598,000 tons. Wild hay increased 29% to 207,000 tons. Bean production increased 32% to 605,000 hundred-pound bags. Sugar beet production increased 18% to 634,000 tons. Potato production rose to 2,400,000 bu. Production of alfalfa seed rose from 68,000 bu. to 104,000 bu. The corn crop increased 9% to 1,930,000 bu. Wheat and oats production increased more than 20%.

It is estimated that close to 400,000 tourists visited Wyoming in 1940 and spent more than \$25,000,000. Hunting and fishing were popular, although low water limited fishing and lack of snow in the fall of 1940 made big-game hunting difficult. (A. T. L.)

X-Ray. Much attention was given during 1940 to developments in the fields of military and naval medicine and surgery.

During the War of 1914-18 literally hundreds of methods were used for localization of foreign bodies in the tissues by means of the X-rays. Only a few of these methods stood the tests of practical use with portable apparatus in mobile hospital units. One in particular, the "Strohl" method, was that finally adopted by the United States army. One adaptation of this method was incorporated in the portable apparatus adopted by the medical department of the United States army for use in any active service in the near future. The new portable X-ray apparatus already under construction in considerable numbers is light in weight, readily transportable, capable of withstanding hard usage, and adaptable to conditions in all types of army hospitals including the surgical mobile unit. In addition to all types of diagnostic work both by fluoroscopy and films, the apparatus can be used for the treatment of inflammations and wound infections.

The value of the X-ray in the examination of the chest is so thoroughly established that the importance of X-ray examination of the chests of everyone inducted into the military service is universally recognized. The Canadian medical service carried out such an examination during 1939 and 1940 for every soldier at time of enlistment, using for that purpose a single 14x17 in. film. The cost of such an examination for the large number of men to be inducted into the United States service would be very high if 14x17 in. films were used. Such films would also present a difficult storage problem.

The medical department of the United States army adopted a method for chest examinations which depends upon photographing the chest image on the fluorescent screen. The picture is obtained on a 4x5 in. film which is readily filed as a permanent part of the soldier's record. The advantages of this method are its low cost (about 1/10 that of the 14x17 in. film), very high diagnostic accuracy, readability without enlargement or projection, low storage requirement and availability of conventional developing equipment. The only disadvantage is the first cost of the equipment which would be more than compensated by the savings in examination of large numbers of men. It is estimated that the equipment would last at least ten years.

The medical department of the United States navy adopted a similar but different method which also depends upon photographing the image upon the fluorescent screen. The film, however, is only 35 mm. in size. This has the lowest cost of any method (perhaps about 1/50 that of the 14x17 in. film). Its advantages are ease and convenience of storage, equipment readily available and not expensive, and processing facilities universally available. The only disadvantage is the necessity for use of a projection apparatus to view the film.

The use of the X-ray for the treatment of localized inflammations is now well established. It is of definite worth in the treatment of carbuncles, boils, localized cellulitis, acute parotitis following surgery and many other infectious conditions. There are numerous reports to indicate the value of the X-ray in treatment of gas gangrene and as a prophylactic against infection in war wounds. It also has a place in treatment of keloids and contractures following healing of wounds. (See also DENTISTRY; HEART AND HEART DISEASES; PHOTOGRAPHY: Applications; STANDARDS, NATIONAL BUREAU OF; TUBERCULOSIS.)

Yachting. Although during the yachting season of 1940 war clouds did not come close enough to American shores to affect materially the number of boats in commission and in competition, their shadows did change considerably the com-

plexion of what have been in former years outstanding events. In Europe, of course, organized yachting activity had been suspended "for the duration." This affected the American scene by all but wiping out the major events with a distinctly international flavour.

The usual winter races for ocean racing craft from Florida ports to Nassau and Havana brought out good fleets, and a team of International class sloops from Long Island sound made an unsuccessful bid for the Amorita cup in a series of team races in Bermuda in April but these could hardly be called major events.

The war washed out the regular biennial ocean race to Bermuda and in its place the Cruising Club of America conducted a 455-mi. contest which started at Block island and took the fleet eastward and northward to Nantucket lightship, Mt. Desert rock off the Maine coast, and thence to the finish at Gloucester, Mass. The fleet was small and the weather encountered was decidedly wet, cold and foggy even for the North Atlantic and gulf of Maine. Henry C. Taylor's big yawl "Baruna," winner of the 1938 Bermuda race, was the victor by several hours. James E. Grove's cutter "Blitzen" was second and the prize for the smaller Class B boats was taken by Robert F. DeCoppet's new Luders-designed sloop "Coquette."

On the Great Lakes, long distance contests continued to be very popular. The famous Chicago-Mackinac race drew a record number of 52 starters. Light, variable winds prevailed over most of the 331-mi. course, and Theodore Lombard's ten-year-old sloop "Bangalore" repeated her victory of the previous year, with the week-old yawl "Tahana," also designed by Rhodes, close behind her in second place. C. Peterson's "Batavia" was third in the fleet and first in Class A. The Detroit-Mackinac race was also well attended and, in contrast, was one of the fastest ever sailed. The winner, James R. Lowe's big Chicago yawl "Manitou" set a new record, sailing the 237-mi. course in less than 33 hours. David Williams's "Sonata" was second.

The Freeman Cup race on Lake Ontario, the Stamford Yacht club's Vineyard race, the Eastern Yacht club's race from New London to Marblehead and the racing cruises of the Eastern, New York, American and Indian Harbor yacht clubs all brought out fine fleets of cruising type yachts. In most of them the honours were divided liberally, although Frank C. Paine's "Gypsy" took both the Eastern Yacht club events.

At such centres as western Long Island sound, and Marblehead, Mass., where class racing has flourished for decades the sport was continued on about the same scale as in years immediately preceding although the trend away from the larger, more expensive, classes continued. On the Sound three 12-metres raced hard throughout the season, but the next smaller one-design or rule class which raced consistently was the scrappy International, barely 30 ft. in overall length.

At Marblehead the 8-metres were the only really large class competing regularly.

In contrast to the situation in the long established centres, small boat racing continued to grow on the Great Lakes, on Chesapeake bay, in the south, on the west coast and particularly on hundreds of inland lakes, both natural and man-made. The class organizations of the smaller nationwide one-design classes such as Comets, Snipes, Lightnings and Stars, have played a big part in this small boat development. On the lakes of Wisconsin and Minnesota interest in the various Scow classes continued to grow with 150 turning out for the championship events on Lake Mendota.

On the Pacific coast the lack of extensive sounds and bays seems to have retarded the progress of cruising type racing as compared to that on the Atlantic coast and the Great Lakes. Southern California, however, has come rapidly to the fore as the country's leading large racing class stronghold. M class yachts, 10-metres, 8-metres, 6-metres and their own Rhodes 33's all mustered good fleets in the 1940 racing.

In spite of the war clouds the world championship of the Star class preserved some of its traditional international flavour with 14 entries from the various U.S. fleets, two from Hawaii, and one each from Cuba and Nassau. A closely contested series of five races was sailed at San Diego with two young Los Angeles skippers, James and Gordon Cowie, bringing their "Rambunctious II" through on top.

The year saw a steady and great increase in the activities of the Inter-Collegiate Yacht Racing association. Contests in sailing dinghies flourished on spring and fall week-ends at scores of colleges and universities in the east and middle west and, thanks to the extensive facilities provided by the Massachusetts Institute of Technology on the Charles river, over 20 teams participated in the Boston Dinghy Cup series in late October. This was won by Princeton. The big event of the spring season was the association's big boat championship in which Williams retained its title defeating four other finalists, Yale, Harvard and the Coast Guard and Naval academies.

(H. L. Sr.)

Yale University. During the academic year 1939-40 the tenth college for undergraduates, Silliman college, made possible by the bequest of Frederick W. Vanderbilt, Ph.B., '76, was completed and two reorganized university departments, one in the history of art, the other in music, were established to provide courses for undergraduate majors and direct work leading to the master's and doctor's degrees.

Dr. Harvey Cushing, who died during the year, gave to the school of medicine his brain tumour registry which embodies his recorded clinical experience of more than 40 years and to the medical library he gave his unrivalled collection of medical and scientific classics. Work was begun on the extension of the library wing of the Sterling hall of medicine to house the Yale medical library.

Gifts and bequests received by the university during the year ending June 30, 1940, totalled \$3,807,117; gross additions to funds

DESPITE A BROKEN SPINNAKER POLE, Harold S. Vanderbilt's "Vim" won the annual regatta of the New Rochelle Yacht club in Long Island sound June 29, 1940

were \$2,860,152, including interest on certain funds; total endowment and reserves were (1941) \$110,541,766, with a net after investment losses of \$101,075,903. In addition, the Sheffield Scientific school trustees have assets of a book value of \$2,837,697.

Outstanding new appointments and promotions for the year were: Leonard Bloomfield, Sterling professor of linguistics; Charles W. Hendel, professor of moral philosophy; Edmund W. Sinnott, Sterling professor of botany; Bronislaw K. Malinowski, Bishop museum professor of anthropology; Professor Filmer S. C. Northrop, master of Silliman college; Professor Ashbel G. Gulliver, dean of the law school.

Yellin, Samuel (1885-1940), U.S. metal worker, was born in Poland, March 2 and began studying art at the age of 11. He went to the United States in 1906 and engaged in the production of decorative metal work. Examples of his handicraft are in the Harkness quadrangle at Yale university, the National cathedral in Washington, D.C. and the Cathedral of St. John the Divine in New York city. He received the Bok award in 1925 as the citizen who had done the most distinguished work in Philadelphia during the previous year. He died in New York city, Oct. 3.

Yemen: see ARABIA.

Yonai, Mitsumasa (1880-), Japanese admiral and prime minister from Jan. 14 to July 16, 1940, was born at Iwate-ken and was graduated from the Japanese naval academy in 1901. After commanding various warships he was promoted to chief of staff of the second fleet, then joined the staff of the naval board. Minister of the navy from 1937 to 1939, he was named supreme war councillor in August of the latter year. After the resignation of Gen. Nobuyuki Abe early in 1940 Yonai was commissioned to form a new government. A political stop-gap, his cabinet was succeeded in July by that of Prince Konoye (q.v.).

Young Men's Christian Association.

The World's Alliance of Young Men's Christian associations was formed in 1855. It is composed of 36 autonomous national alliances and associations in 28 other countries affiliated informally. The headquarters of its world's committee and executive are located at Geneva, Switzerland. Its 21st world's conference met in Mysore, India, in Jan. 1937. A World's Young Men's conference met at Amsterdam, following the World Conference of Christian Youth in June 1939. Last available reports (Jan. 1, 1939) showed 10,500 associations with 1,960,226 members, predominantly young men and boys. A body of secretaries or professional workers numbering 6,002 was reported. Concerns of immediate importance to the alliance include the menace of war, participation in direct war-service by various national alliances, and reciprocal service to war-prisoners under World's Alliance auspices; the contribution of Christian youth to a peaceful world order; public policies affecting the place and opportunity of youth; and the emergence of a universal Christian community. Publications: *Youth in the New World*, *Flaming Milestone*, *World's Youth*; a quarterly journal, are published by the World's Committee, Y.M.C.A., Geneva; *Y.M.C.A. Year Book for 1940*, National Council, Y.M.C.A., New York. (O. E. P.)

Young Men's Hebrew Association and Young Women's Hebrew Association: see JEWISH WELFARE BOARD.

Young Women's Christian Association.

The 16th national convention of the Y.W.C.A.'s of the U.S.A. met in Atlantic City, N.J. in April, 1940, bringing together delegates from 44 states, the Hawaiian islands and 10 other countries. The year 1940 marked for the Y.W.C.A. the completion of 85 years of service to women and girls, begun in London in 1855. This anniversary was the occasion for a special celebration at the convention, during which a broadcast by Queen Elizabeth of England was heard. The concern of the Y.W.C.A. in the United States for member associations in countries affected by the war became intensified as the year progressed. Special funds were raised to help associations in China and Europe not only to carry on their regular work but to provide an emergency program including the giving of aid to refugees, assisting in the rehabilitation of evacuees from war zones, and similar activities. In the

AS A PROTEST against procommunist inclinations of the National Youth congress in Feb. 1940, these young men and women called on their fellow delegates to avoid all foreign "isms"

autumn a temporary branch office of the world's headquarters in Geneva, Switzerland, was opened in Washington, D.C., to facilitate communications with countries in which the Y.W.C.A. is at work.

In the United States the recreation, education and fellowship programs of the more than 1,400 local centres were participated in by more than 3,000,000 women and girls. (M. S. Ss.)

Youth Movements are an organized effort at political, cultural and social self-expression of young people. In totalitarian states these youth movements are strictly regimented and made completely subservient to the aims of the state. This is the case in Germany, Italy and Russia, and has lately been imitated in other states like Rumania and France, when they came under fascist control. With her fascistization Japan began to institute a similar youth movement. Fumio Goto, the director of the planning board of the new totalitarian party in Japan, declared that 60,000 young leaders were to be recruited from the nation's youth for the future leadership of totalitarian Japan, following the example set by national socialist youth education. In Nov. 1940 the soviet union mobilized 500,000 young people between 14 and 17 years to form a semi-military state labour reserve corps. Each year about 800,000 to 1,000,000 boys will be called up for compulsory courses varying from six months to two years, after which time they will do four years' work under state order. At the same time the need for strict discipline among the "Pioneers," the youngest branch of the communist youth movement, was emphasized, and children were ordered to respect adults and to devote their play to military games and to sports which would prove useful in case of war.

The leader of the German youth movement, Baldur von Schirach, was made provincial governor of Vienna, but retained his position as head of the education of youth and inspector of the entire Hitler youth organization. His successor as active head of the Hitler youth was Arthur Axmann.

In view of the complete regimentation and militarization of the soviet youth and of the immense importance which military conscription plays in the soviet "democracy," it was astonishing that the American communist youth and the several youth organizations where it had influence objected violently to the introduction of conscription in a much milder form in the United States. Only a very small part of American youth was in 1940 organized in youth movements, of which many, like the Boy Scouts and different church groups, were entirely apolitical. On the other hand, some of them tried to play a definite political role, among them the American Youth congress, which was established in the summer of 1934 and which formed in 1940 the centre of much controversy. Its opposition to conscription and to aid for Great Britain led to a split on occasion of its 6th national meeting in July at Lake Geneva, Wis. During the Christmas period the annual conference of the American Student union followed the line of the American Youth congress, and protested President Roosevelt's foreign policy, while at its conference the National Student Federation of America, one of the founders of the American Youth congress, withdrew from this organization on the issue of the latter's alleged radical tendencies.

(H. Ko.)

Yugoslavia, a kingdom in southeastern Europe, with an area of 95,558 sq.mi. and a population of about 15,800,000. In view of the minority of King Peter II, his uncle, Prince Pavel, is the regent. The population of Yugoslavia is southern Slav, divided into three branches—the Greek Orthodox Serbs, who have lived for many centuries under Turkish domination; the Catholic Croats, who are racially and linguistically

identical with the Serbs, but differentiated through history and religion, having lived for centuries in contact with and under Vienna; and to the northwest of them the Catholic Slovenes, speaking a somewhat different language. In addition there are Mohammedans who in spite of their religion are largely of Slav origin, small German and Hungarian minorities, and a larger Bulgarian minority in Macedonia.

Yugoslavia, which was formed after the War of 1914-18 by the addition of the formerly Austrian territories of the Slovenes and the Croats, and of Montenegro, to the Serbian kingdom, suffered for many years from the antagonism between the Serbs who wished a centralized kingdom under their predominance and the Croats who pleaded for equality of the three branches of the southern Slav race and for Croat autonomy. This long dispute was terminated on Aug. 25, 1939, when an understanding was reached between the Serbs and the Croats, the reintroduction of democracy and free elections was promised, the Croats received a fair measure of autonomy with their own diet, and the leader of the Croats, Dr. Vladimir Matchek, became vice-premier in a coalition cabinet headed by Dragisha Cvetkovitch. An official visit by the prince regent on Jan. 14 to the Croat capital, Zagreb, confirmed the new friendship.

The main concern of Yugoslavia during 1940 was, in view of the European war, the foreign policy. Yugoslavia pursued a policy of strict neutrality, although it leaned towards the axis, partly out of weakness and geographic conditions, partly out of the inclinations of a certain group of political leaders like the former Prime Minister Milan Stoyadinovitch and the Slovene leader Father Anton Koroshetz, the minister of public education and president of the senate, who died on Dec. 14, 1940. At the conference of the Balkan Entente in Belgrade at the beginning of February, Yugoslavia opposed all moves towards stronger Balkan solidarity against any outside aggression, and generally took a line in harmony with Italy. But the Belgrade government took energetic measures when in the middle of April the Yugoslav police unearthed a fascist plot under the leadership of Dr. Milan Stoyadinovitch, who was exiled from the capital to a distant provincial town as a result. The great successes of Germany in the late spring, Italy's entrance into the war, and France's surrender, induced Yugoslavia to follow a more cautious policy and to release Dr. Stoyadinovitch. The grave reverses suffered by the Italian army in her war against Greece awakened in the Yugoslav army and the war minister, General Milan Neditch, the desire for an active policy on the part of Yugoslavia to prevent a fate similar to that which had befallen Rumania, but the tendency of Father Koroshetz prevailed, General Neditch resigned, and Yugoslavia emphasized her sympathy with the axis powers, leaving it undecided by the end of 1940, in spite of some solemn declarations, whether Yugoslavia would offer armed resistance to any advance of German or Italian troops into the country's territory. A commercial pact with Germany of Oct. 19 subordinated Yugoslav economic life to the exigencies of German economy. At the beginning of December the Hungarian Foreign Minister Count Csaky visited Belgrade and concluded on Dec. 11 a treaty of "everlasting friendship" between the two countries, the true impact of which only future events would reveal. (See also BALKAN ENTENTE; EUROPEAN WAR; LITTLE ENTENTE.) (H. Ko.)

Yukon Territory, the most westerly of the northern territories of Canada, was created a separate territory in June 1898, by act of parliament (the Yukon act). It has a total area of 207,076 sq.mi., and a population of 4,000 (estimate, Dominion Bureau of Statistics, 1935). At the height of the gold mining boom (1901) the population was 27,219. The seat of government is Dawson.

By amending legislation, provision has been made for a local government composed of a chief executive, the controller, and an elective legislative council of three members with a three year tenure of office. The controller administers the government of the territory under instructions from the governor-general-in-council.

Mining is the chief industry, closely followed by trapping, and some fishing. In 1939 the Yukon (together with the Northwest Territories) produced \$7,034,291 worth of minerals and over 60,000 fur pelts.

World Total	1,472.8	789.9	1,667.9	1,589.7	1,678.1
Ex. U.S.	899.8	596.2	1,133.0	1,175.1	1,189.8

World zinc output increased by 6% in 1939, to a total of 1,678,100 metric tons, the increases being chiefly in the United States, Germany, Mexico, Poland, Canada and Spain, partially offset by decreases in Belgium, Great Britain, the Netherlands and France.

Production data for 1940 are limited to the United States and Mexico.

Domestic primary zinc production in the United States in 1940 increased by 20% to a new record at 643,400 short tons, in addition to which there was an appreciable output from foreign ores. Ores imported for consumption in the first 11 months of 1940 had a zinc content of 42,300 tons, and ores for processing and export a content of 61,900 tons. Shipments to consumers also made a new record at 696,500 tons, up 16% from 1939. Stocks at the end of 1940 were only 12,900 tons, 10% of the amount held in 1938.

Mine production of zinc in Mexico during the first seven months of 1940 was down 29% from the same period of 1939, to 64,250 metric tons; much of this is smelted in the United States.

Through occupation of the countries, Germany gained control of 213,000 metric tons of smelting capacity in Belgium, 112,000 tons in Poland, 61,000 tons in France, 47,000 tons in Norway, and 26,000 tons in the Netherlands, a total of approximately 460,000 tons, but mine production is limited to about 70,000 tons, mostly in Poland, and all sources of imported ores were by Jan. 1, 1941, cut off.

(G. A. Ro.)

Zinsser, Hans (1878-1940), U.S. bacteriologist, was born in New York city, Nov. 17. He was graduated from Columbia university in 1899 and from the college of physicians and surgeons there in 1903. He served as a hospital in-

tern for two years, then began his career as a bacteriologist at the Roosevelt hospital and at Columbia university in New York city. He taught bacteriology in Stanford university for three years from 1910 and was then professor of bacteriology for 10 years at Columbia. In 1923 he was made professor of bacteriology and immunity in the medical school of Harvard university. He was a member of the American Red Cross sanitary commission to Serbia in 1915 and in 1917 entered the medical corps of the United States army as a major, and was later promoted to the rank of colonel. In 1923 he was sanitary commissioner in Russia for the League of Nations health section. He was a member of many scientific and learned organizations. Besides two books on bacteriology he wrote *Rats, Lice and History* and an autobiography, *As I Remember Him*, each of which had a large popular sale. He died in New York city, Sept. 4.

Zirconium. The use of zirconium as pure metal and as a ferro-alloy has been increasing, but the main consumption is in enamels, welding-rod coating, and as a refractory. Production is largely in Australia, Brazil and India. Imports of ore into the United States have declined heavily since 1937 and were only 1,483 short tons in 1939, while imports of ferro-alloys were 400 tons. Ore imports were mainly from Australia and alloys were almost entirely from Norway. (G. A. Ro.)

Zoological Gardens. The San Diego, Calif., Zoological society offered two scholarships of \$1,000 each in 1940 for advanced graduate students to work at the research laboratory. Dr. Wedgeforth, president of the Zoological society of San Diego, visited Bengal, India, to collect specimens. By the generosity of Harvey Firestone, an expedition visited Liberia to collect wild animals, led by William S. Mann, director of the National Zoological park. Among animals sent from South America to New York city were 24 two-toed sloths.

Europe.—The Zoological society of London lost a valuable friend and former president by the death of the duke of Bedford. Martin Duncan, librarian, retired and F. G. Boulenger went to the war office. Officers of the Royal Tank corps adopted three giant tortoises, and Lord Moyne readopted some Dutch East Indian animals he had presented. There were 350 animals adopted.

In August the zoo opened to the paying public on Sundays. All forces in uniform enter free on Sundays and at half price on week-days. "Pigeon-grams," in aid of the Red Cross, were instituted in June. A recruiting tent for the Women's Land army was opened and a War Utility exhibition held to encourage gardening, anti-waste and keeping useful animals.

Whipsnade opened on Feb. 1 and had 11,000 visitors on Easter Monday. The adult giant panda died and the baby giant panda returned to the London zoo.

About 20,000 evacuated children visited Brighton aquarium before it closed (after 100 years) and sent its rare tropical fish to the London zoo. When Maidstone zoo reopened in March, all forces in uniform were admitted at half price. Dudley zoo, with the aquarium restocked, opened as usual, and an adoption scheme enabled Chester to continue.

The Scottish National Zoological park admits all forces in uniform free. Work will not begin on the Glasgow zoo until peace is restored. At Dublin a new bison enclosure was finished and open-air quarters for lions begun. Two llamas and a Highland heifer were acquired from the Edinburgh zoo.

Paris zoo aquarium distributed its reptiles to the Marseilles zoo and its fish to the prince of Monaco's aquarium at Monte Carlo and to private people. Captain Jean Delacour gave a party in aid of the Red Cross at his zoo in June. Warsaw zoo, built at great cost, has, under German rule, been converted into a pig-fattening farm. In Germany the Berlin aquarium closed and its reptiles were destroyed. Zoo carnivores were rationed to five horses a day instead of six, and apes had dried fruit instead of bananas. Hamburg disposed of its collection, and Dinslaken zoo was converted to rear rabbits, poultry, pigs and silkworms.

Asia.—Bombay zoo sold surplus lions and tigers. Since gorillas are expensive to procure and maintain, the Madras zoo set up a life-sized statue in realistic surroundings instead.

Africa.—The Pretoria zoo, opened in 1899, one of the oldest in Africa and the oldest in the Union of South Africa, continued with part of the building scheme held up when war broke out. R. Bigalkie, the director, published *Animals and Zoos Everywhere*.

Australia.—The Adelaide zoo acquired a short-nosed bandicoot, a rare animal which used to be common. At Yanchep several thousand eucalyptus trees were planted for the koalas on show there. (V. R.)

Zoology. **General.**—The American Society of Zoologists held its annual meeting at Philadelphia, Pa., on Dec. 30

and 31, 1940, and Jan. 1, 1941. At that meeting 333 papers were listed of which 26% was devoted to general physiology; 22% to endocrinology; 19% to ecology, morphology and miscellaneous; 17% to embryology; 9% to cytology; 5% to cellular physiology; and 2% to protozoology. In addition, animal genetics was represented in meetings of the Genetics Society of America by 99 papers, and animal ecology in meetings of the Ecological Society of America by 49 papers. Also, there were three general symposia of zoological interest: (1) "Population Problems in Protozoa"; (2) "Endocrine Control of the Mammalian Reproductive Cycle"; and (3) "Human Ecology."

Major Trends.—The year 1940 witnessed general trends in zoology that were largely continuations of research already in progress. Certain of these trends may be indicated as follows:

(1) The interest of geneticists, embryologists and biochemists in the chemical aspects of differentiation and growth continued as an active phase of zoological experimental science. A newly formed organization, the Society for Development and Growth, held its second summer meeting at Salisbury Cove, Me., where a number of topics relevant to this trend were discussed.

(2) The active interest in animal populations continued apace. The symposium mentioned above on Protozoa was one evidence for this trend. The literature was increased by a number of papers dealing with both genetic (hereditary) and ecological (environmental) aspects of populations.

(3) Taxonomy and evolution received two notable stimuli during 1940. One was the publication of an English book edited by Huxley entitled *The New Systematics* that brought together and synthesized a wealth of important material about evolutionary facts and concepts. The other was the formation of a new American society, Association for the Study of Speciation, designed to organize and unify a diverse group of biologists interested in such problems. The population approach received ample recognition in both these enterprises and thus drew closer to modern evolution studies.

(4) There was a heightened interest in the effect of hormones on behaviour responses. The zoologists' symposium on mammalian reproduction had papers concerned with this phase of zoology.

(5) A significant development was the sharpened interest of zoologists in the biology of social problems and society. This trend has been developing since 1930 and reached perhaps its peak in 1940. A distinguished symposium called "The Biological Basis of Social Problems" was held in Monterey, Calif., and was well received. The proceedings of the symposium were published in the *American Naturalist* (Sept.-Oct. 1940).

Specific Contributions.—**Endocrinology.**—Much evidence has accumulated showing that the sex glands of many vertebrates are under the close control of internal chemical activators known as hormones. Until recently it has been supposed that most invertebrates lack this type of mechanism—in short, that sex differentiation due to hormones was uniquely a property of the back-boned animals. A study reported by Pfeiffer in 1940 alters this picture since she describes such a hormone effect in the female locust, *Melanoplus differentialis*. In these studies it is demonstrated that a small, glandular, bilobed body lying in the head dorsal to the gut and known as the corpora allata secretes a substance into the blood that (a) stimulates the production of a secretion in the egg-tubes or oviducts and (b) permits the eggs to develop. When the gland is surgically extirpated these two normal functions fail. If only one lobe of the gland is removed the other lobe compensates or overgrows and there is no impairment of sex activity. When the corpora allata were removed from male locusts no effects on the male genital tract could be detected. However, it was proved that the gland's secretion was not sex specific by the following experiment. Female grasshoppers had their corpora allata removed and destroyed. Then the loss of these glands was rectified by implanting, as grafts into the female, corpora carefully removed from males. In these cases where the latter grew or "took," the females' oviducts and eggs developed normally. In short, the male corpora allata has the capacity for supplying the hormone needed by the female.

Animal Behaviour.—"Behaviour problems can be attacked experimentally through endocrine manipulation." A new study that falls into this category on the sword-tail (*Xiphophorus helleri*) was reported by Noble and Borne. In various birds, as well as certain fish, a social order or "hierarchy" exists in which a dominant or despot animal pecks on contact a subordinate member of the population. This pecking behaviour brings a certain social order into the group. Noble was able to change the pecking orders within a school of female sword-tails by injecting certain fish with vertebrate male hormone, testosterone propionate. A subordinate fish is treated on alternate days. After about 12 days the fish becomes more aggressive and soon attains a higher place in the group peck-order than she had before treatment. By "higher" is meant that she now dominates fish which previously dominated her. If hormone treatment is continued the fish develops rudimentary male structures (e.g., a tail "sword") as well as male behaviour. She may attempt unsuccessfully to copulate with the remaining females. Noble points out that sex hormones cause "... female sword-tails to rise in their social hierarchies only by bringing a reversal of sex."

Phylogeny.—In an important paper on the primitive animals known as "Protura" Ewing holds that these forms and true insects had a common "hexapod" ancestor. He proposes the following classification of the six-legged Arthropods: Superclass, Hexapoda; Class I, Collembola; Class II, Protura; Class III, Insecta; Subclass I, Thysanura and Subclass II, Pterygota. (See BACTERIOLOGY; ENTOMOLOGY; OCEANOGRAPHY; PALAEO-TOLOGY.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example, "Academic Freedom 41, 40, 39, 38" indicates that the entry "Academic Freedom" is to be found in the 1941 *Book of the Year*, the 1940 *Book of the Year*, the 1939 *Book of the Year* and the 1938 *Book of the Year*. The reference "Adult Education: see Education, Adult 41, 40, 39. See Adult Education 38" indicates that the entry "Adult Education" is to be found under the heading "Education, Adult" in the 1941 *Book of the Year*, the 1940 *Book of the Year* and the 1939 *Book of the Year* and under the heading "Adult Education" in the 1938 *Book of the Year*.

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
